JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., ANNUAL, 1925. No. 13

GENERAL SUMMARY.

The temperature for the year averaged somewhat above normal, but marked departures from seasonal conditions characterized several of the months. February, with one exception, was the warmest month of the name on record. The mean temperatures of April and May were the same. June averaged warmer than July or August; while September, the warmest of record, was warmer than any of the summer months, and its average temperature exceeded the normal mean for July. Precipitation was considerably less than normal and seriously deficient through the growing season. Its areal distribution was extremely irregular. Except in February, which showed a small excess, precipitation was deficient in every month from January to August, inclusive, and also in December, which was the driest of record. From January to March the soil remained most of the time in a well drained condition, hence the winter freezes had slight lifting effect on wheat and grasses. Warm weather and abundant sunshine in February and March prematurely developed fruit buds, and greatly advanced grains and pastures. The warm April following caused fruit trees to bloom early, and quickly brought the first vegetables to maturity. The cool, dry May adversely affected germination and growth, but favored cultivation. During the month the need for rain became acute in the northern and western counties. Depletion of subsoil moisture, due to the dry winter and spring, was the underlying cause of the early appearance of drought. Rains in June reached most districts, but deep saturation rarely occurred. After these rains the extreme northern counties received sufficient moisture, but crops suffered more or less at times in most other districts. High temperatures and the dry subsoil largely offset the effect of the rains. The yield of deeply rooted crops, such as alfalfa, clover, timothy, etc., was much reduced. The acreage of tobacco was reduced because transplanting in the hilly section could not be completed. The July rains were badly distributed and large areas, mainly south-central, again became quite dry. August, the driest month of the growing season, intensified the unfavorable conditions. Water shortage had appeared locally early in the summer, but now the situation became so acute as to cause great inconvenience in obtaining stock water and much anxiety regarding the purity of domestic supplies. These conditions grew worse in September, until gradually relieved by the frequent light rains late in the month. The extreme September heat and the failure of the August rains rendered hopeless the situation of the late crops of corn, tobacco and potatoes. October, cold with persistent rains and heavy snow, had few days on which outdoor work could be comfortably performed. November, also cold and wet, delayed corn gathering. The prevailing humid atmosphere in October and November, together with the inclement conditions outdoors, led to good progress in tobacco stripping. Pastures continued fairly good until the middle of December. The year was remarkable for tornadoes, which occurred on March 18th, October 16th, and December 4th. These storms killed 21 persons, injured 203, and caused damage estimated at $1,380,000.

The Weather By Months.

JANUARY.—Temperatures were variable, with mild weather predominating, until the 26th. The month ended with a cold wave, accompanied by considerable snow that afforded some protection to wheat. Precipitation was light, but occurred so frequently as to render conditions favorable for handling tobacco.

FEBRUARY.—Temperatures were moderate and at times spring-like until near the close, when the untimely tendencies of fruit trees to bloom were checked by cold weather. Light precipitation and comparatively dry soil led to excellent progress in early plowing and sowing tobacco seed.

MARCH.—After a few cold days at the beginning, temperatures were moderate to unseasonably high. Plums bloomed as early as the second week and were damaged by freezes later on. Frequent frosts and occasional light freezes were beneficial in retarding other fruits. Comparatively light precipitation contributed to rapid progress in plowing, gardening, potato planting and sowing plantbeds.

APRIL.—Temperatures averaged above normal almost continuously. Precipitation was light, and seasonal activities advanced with exceptional rapidity. There were no general frosts after the 1st. Early wheat commenced to joint by the second week. Farm operations and the condition of vegetation were one to two weeks ahead of the season.

MAY.—The month was cool, dry, and generally unfavorable. In the northern counties frost caused serious damage to corn on lowlands on the 25th and 26th. Tender vegetables were injured in northern, central and western districts. Dry weather interfered with tobacco setting.

JUNE.—Drought prevailed in the eastern counties during the first three weeks, but rains brought relief to most districts in the last decade. Tobacco setting was seriously hindered. Early potatoes made a poor crop. Oats headed very short, and all hay crops gave light yields.

COMPARATIVE ANNUAL DATA FOR KENTUCKY.

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.
†Also on other dates.

JUNE.—The rainfall averaged near normal, and temperatures were moderate after the first week. Some localities received enough rain, while others remained too dry. Latest tobacco died badly before the rains came, and the crop developed unevenly. Corn improved in most districts. Drought continued in the lower Green River Valley.

JULY.—Except in the northern bluegrass region, the rainfall was very light. High temperatures and deficient moisture caused the drought areas to expand to include most central and southern districts. Tobacco cutting was forced by "firing", and the late crop made little growth. Late potatoes and late corn were seriously injured.

AUGUST.—Drought continued during the first decade. Late crops deteriorated and the water shortage became worse. Rains that occurred after the 10th partly replenished the water supply, but were too late to help the crops.

OCTOBER.—The month was exceptionally cold, cloudy, and unfavorable, with rain nearly every day. Corn molded in the shock and wheat sowing could not be completed. The snowfall, ranging between 3.0 and 6.5 inches, was unprecedented for this month. Pastures and rye furnished excellent grazing.

NOVEMBER.—Temperatures were variable, but cold weather predominated. Precipitation averaged above normal and interfered with outdoor work. Wheat grew slowly and remained small, but was generally well rooted. Pastures remained fairly good.

DECEMBER.—Moderate temperature and dry weather during the first three weeks enabled farmers to finish gathering corn. Wheat made some growth early in the month. Severe cold in the last decade caused ice gorges to form in the Ohio River.

Monthly and Annual Precipitation for the Year 1925, with Departures from the Normal.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determing in section or division means. T. Precipitation is less than 0.01 inch rain or melted snow.

†Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Monthly and Annual Mean Temperatures for the Year 1925, with Departures from the Normal.

All temperature data are taken from self registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

NOTE.—Tables and charts giving climatic data for Kentucky in detail during 1925 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in Charge at that office. Indexes to special articles published during past years in Kentucky climatological reports will be found in the Monthly Report for June, 1909.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., JANUARY, 1926. No. 1

MAR 8 1926

GENERAL SUMMARY.

The temperature averaged not far from normal, but the weather was characterized by extreme departures in both directions. Alternating periods of abnormal warmth and sharp cold, about a week in length, resulted in decidedly changeable and at times quite severe conditions. Two cold waves that brought temperatures near zero to most districts occurred in the last decade. The first was ushered in with heavy snow that protected winter grains during the period of most severe temperatures. The other occurred with the ground practically bare, but was brief in duration. Heavy snow that prevailed on the 8th lay on the ground through a week of hard freezes, affording almost complete protection to wheat in the northern counties. Although winter grains were lifted to some extent by the freezing of soil temporarily saturated at the surface by rain or melted snow; good drainage during the warmer weather, or snow that accompanied the heaviest precipitation and lay on the ground for several days thereafter, served to largely prevent the usual midwinter injury. It was only on heavy clay uplands or exceptionally water soaked and badly drained spots that serious heaving occurred. At the close of the month wheat was reported as fairly good and generally equal to its average condition at this time in the winter. Warm, moist weather, with much fog, in the first week, led to the resumption of tobacco stripping, but the work was afterward interrupted by the frequent cold waves. Marketing was hindered by the bad condition of the roads. The complete thaws that followed the deep freezes caused macadamized roads to give way under heavy traffic, resulting in much damage. Dirt roads were either deep in mud or frozen rough. The cold waves caused some loss of young livestock, and necessitated special care and feeding. In the last decade heavy rains and melting snow caused freshets, with crests near flood stage, in the streams of the State.

TEMPERATURE.

The average temperature for the State, based on reports from 42 stations was 34.4°, which is 1.1° below normal. Temperatures averaged between 5° and 20° above normal in the periods 2d-5th, 16-20th, and 30th-31st; and as much below normal in the periods 8-10th, 12-14th, 22d-24th, and 28-29th. In the warm spells temperatures rose above 60° at many stations, while in the three last cold waves they fell below zero in northern districts. Extremes for the State were 69° at Williamsburg on the 20th and −11° at Farmers on the 14th.

PRECIPITATION.

The average precipitation for the State, 76 stations reporting, was 4.01 inches, which is 0.37 inch below normal for January. In a broad belt extending northeast-southwest from the Purchase to the Big Sandy, and including most of the State, amounts ranged between 4.00 and 5.50 inches. Along the Ohio and in the southeast border counties, they ranged from 2.5 to 3.5 inches. Light to moderate rain occurred from the 3d to 5th, and heavy rains in the periods 17-19th and 21st-22d. There was heavy snow over most of the State on the 8th and 9th, and light to moderate snow in the periods 21st-22d and 26-27th. The total snowfall varied between 2.5 inches in the southwestern counties and 14.5 inches in the Lower Licking Valley. Precipitation extremes were 5.65 inches at Mt. Sterling and 2.24 inches at Cold Spring, Campbell County. Thunderstorms were reported from a few stations on the 17th.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section, or division means.
Dagger symbols (†, ‡, §, ¶, appearing in the table indicate number of days missing; for example, b represents two days, etc.
Reference letters, *, a, appearing in the table indicate number of days missing; for example, b represents two days, etc.
[a] Also on other dates. [b] Received too late to be included in means and summaries. [c] Precipitation is less than 0.01 inch rain or melted snow.
[d] Post-office addresses: [e] Lock 5, Lawrenceburg, Ky.; [f] Lock 6, Versailles, Ky.; [g] Lock 8, Nicholasville Ky.; [h] Lock 10, Red House, Ky.; [i] Scott, Covington, Ky.
[k] Lone Oak, Ky.

MISCELLANEOUS.

Rivers:—There was more or less ice running in the Ohio, causing suspension of navigation, from the 1st to the 20th. A gorge that formed between the mouth of Wolf Creek and Dam 44 during the 1st week, held until the 23d, when it passed out gradually on a rising river without damage. The heavy rains

Daily Precipitation for January, 1926

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak.

and melting snow of the 21st-22d caused a sharp rise in all stages were exceeded by several feet in the Barren and Green rivers of the State. The Ohio passed the flood stage in the Rivers, but were not reached in other tributary streams. Evansville district, and crested near flood at Cloverport. Flood

Daily Tempera[illegible] January, 1926.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., FEBRUARY, 1926. No. 2

GENERAL SUMMARY.

Several warm spells of two or three days duration, alternating with short periods of subnormal temperature, caused frequent and quite sharp variations in temperature conditions. As a result of the changeable weather, deep thawing followed by lifting freezes caused some damage to grains and clovers. During the first two weeks, soil drainage improved because of the light precipitation; but heavy rains after the middle of the month, followed later by repeated showers, kept the soil saturated and favored lifting by the recurring freezes. Except where sown on heavy clays, lacking sufficient drainage, early wheat escaped serious injury; but late wheat showed marked and continual deterioration. Slight growth of grasses and grains occurred late in the month, but a sharp cold wave near the end again rendered all vegetation dormant. The warmth was not sufficiently prolonged at any time to affect fruit buds, which appeared to be in excellent condition. The comparatively dry weather of the first half enabled farmers to commence spring plowing, but rain soon stopped the work and prevented its resumption. Frequent precipitation and generally inclement weather in the last decade also prevented the usual progress in sowing tobacco plantbeds, therefore only a beginning could be made with this work. Other outdoor activities were deferred, awaiting more favorable weather. The many showers, and predominance of moderate temperature, were favorable for the completion of stripping and marketing tobacco. Movement to market was handicapped by bad roads. Many improved roads became so soft that they had to be protected against heavy hauling. Livestock fared well, for the brief cold waves were too short to occasion any loss of consequence. For the most part snow occurred only in flurries or squalls, offering little protection to wheat.

TEMPERATURE.

The average temperature for the State, based on reports from 43 stations, was 41.1°, which is 5.1° above normal. Departures were 10° to 15° above normal in the frequent short, warm periods, and 5° to 10° below normal on the cold days. Maxima on the warm days rose above 60° at many stations, while minima on the colder mornings registered usually from 15° to 20°. The sharp temperature changes rendered the weather exceptionally disagreeable. The highest for the State was 70° at Hindman on the 14th and Earlington on the 21st, and the lowest 4° at Williamstown on the 11th.

PRECIPITATION.

The average precipitation for the State, 78 stations reporting, was 3.14 inches, which is 0.39 inch less than normal. In the southwestern counties amounts ranged between 1.0 and 2.0 inches; but they increased with marked irregularity toward the eastern and northern districts, where they varied between 3.0 and 5.0 inches. In a broad east-west belt through the center of the State, they ranged from 2.0 to 3.0 inches. On the uplands, of the northern, eastern, and west-central counties, the total snowfall ranged between 1.0 and 3.0 inches at most stations; while near the lower Ohio and in the southern counties the amount was slight. Precipitation varying from light to moderate, and ending at times with snow squalls, occurred in the periods 1st-3d, 9-15th, 18-19th, and 22d-27th. Rains were heavy locally on the 13th and 14th. Thunderstorms were reported on the 13th, 14th, 18th, and 25th. Hail accompanied the storm of the 13th near Louisville and St. John. Precipitation extremes for the State were 5.87 inches at Oneonta and 1.27 inches at Hopkinsville.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch. * Precipitation included in the next following measurement.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Long Oak.

Rivers:—Comparatively high stages prevailed in the Ohio, Green subsided during the first week. Other tributaries in this River during most of the month. The freshet in the Upper State were generally at moderate or low stages

Daily Temperatures for February, 1926.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., MARCH, 1926. No. 3

GENERAL SUMMARY.

Except for a short period in the latter half of the month, the weather continued unseasonably cold and persistently unfavorable for farming and gardening activities appropriate to the early spring. The temperature averaged lower than in February preceding, and weather conditions most of the time were characteristic of mid-winter. Because of the comparatively light precipitation, the better soils remained well drained, so that lifting of grains and grasses was much less serious than usually accompanies such severe temperatures in March. On heavy clays there was some further injury, but in general early wheat maintained its fairly good condition. The deterioration and poor condition of late wheat, however, led to preparations to plow up a large part of it. In the period of moderate temperature, which began on the 18th and lasted about a week, considerable plowing was done and about three-fourths of the tobacco plant-beds were sown. A few farmers sowed oats at this time, and gardeners began planting potatoes and other early vegetables. Planting had scarcely commenced when all outdoor activities were stopped by snow or rain and freezing temperatures, that ushered in a period of cold weather that continued until the end of the month. Tobacco seed and seeds of early vegetables, even in cold frames, generally failed to germinate, largely because of lack of sunshine. Much young clover that had sprouted in the warm week was killed by subsequent freezes. Fruit buds developed rapidly for a few days and peaches began to bloom in the southwestern counties. The peach buds that opened were killed by the freezes; but in most of the State these represented only a small percentage of the total number. Other fruit suffered no apparent injury. Bluegrass on dry, warm slopes made a good start and furnished some pasturage. Rye pastures also improved. Except for a short time, it was necessary to feed and protect stock as in a winter month.

TEMPERATURE.

The average temperature for the State, based on reports from 43 stations, was 40.2°, which is 6.2° below normal and the third lowest of record. Mean temperatures were continuously below normal from the 2nd to 17th inclusive, and again from the 26th to the end of the month. Minimum temperatures in those periods ranged from 10° to 25°. On the 14th, which was the coldest day, they registered between 4° and 10° at most eastern stations. Extremes for the State were 84° at Franklin on the 18th, and 4° at Beattyville and Quicksand on the 14th.

PRECIPITATION.

The average precipitation for the State, 75 stations reporting, was 2.80 inches, which is 2.04 inches less than normal. It was lightest in the northern, extreme western, and east-central counties, where monthly amounts ranged between 2.0 and 3.0 inches. In the district extending from the central bluegrass southwestward to the lower Cumberland, from 3.6 to 5.0 inches occurred. Snowfall in the northeastern counties and in the mountain region was 2.0 to 6.0 inches. It diminished to mere flurries in the western districts. Precipitation was reported from some part of the State on every day. Except for heavy rains on the 22d and 23d, 24-hour amounts were usually light. The periods with general showers were 7-8th; 11-13th; 15-17th; 20th-23d, and 30th-31st. Precipitation extremes were 1.80 inches at Pikeville and 4.95 inches at Bowling Green No. 2. Thunderstorms were reported from a few stations on the 22d, 30th, and 31st.

State averages and extremes

All temperature data are taken from self-registering thermometers.

Only stations having ten or more years of record, but all complete reports are published.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published.

Dashes (—) indicate that no records are available. Locks on the Green River; other Locks are on the Kentucky River.

Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Dams are designated by numbers.

Used in deducing section or division means.

Lone Oak.

References (letters, [a], [b], etc.) appearing in the table indicate number of days missing; for example, [a] represents two days, or

Precipitation is less than 0.01 inch rain or melted snow.

References (letters, [a], [b], etc.) appearing in the table indicate number of days missing; for example, [a] represents two days, or

T. Precipitation is less than 0.01 inch rain or melted snow.

[a] Also on other dates. [b] Record of too late to be included in means and summaries. [c] Scott, Covington, Ky.

[d] Best official records—Locks 6, Lockport, Ky.; Lock 7, Carrollton, Ky.; Lock 8, Versailles, Ky.; Locks Nicholasville, Ky.; Lock 10, Red House, Ky.;

[e] Post office closed Sundays. [f] Lock 6, Lockport, Ky.; Lock 7, Carrollton, Ky.; Lock 8, Versailles, Ky.; Locks Nicholasville Ky.; Lock 10, Red House, Ky.;

[g] Lock 6, Lockport, Ky.; Lock 7, Carrollton, Ky.; Lock 8, Versailles, Ky.; Locks Nicholasville Ky.; Lock 10, Red House, Ky.;

MISCELLANEOUS.

Floods.—Stages were moderately high in the Ohio during the first and last weeks; and a freshet that crested a few feet below flood stage occurred in the Green on the 25th and 26th. Low stages prevailed in other streams.

Daily Precipitation for March, 1926

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak

Daily Temperatures for March, 1926.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., APRIL, 1926. No. 4

GENERAL SUMMARY.

Temperatures almost continuously below normal so retarded growth that at the close of the month vegetation was two to three weeks behind its usual stage in a normal season. Except peaches the blooming of fruit was delayed until after the time of severe freezes. Some peach buds opened during the second week, and were killed by temperatures ranging from 23° to 32° in the period 16-20th. In most localities, however, enough buds remained comparatively dormant and opened later to give promise of a light crop of peaches. Other fruit bloom was unusually heavy. In the first two weeks frequent showers kept the soil wet, hence plowing, gardening, and early planting remained almost at a standstill. In the last two weeks, which were fairly dry, the well drained soils could be worked. Plowing progressed rapidly in southern and western counties, but rains caused further delay in central and northern districts. Wheat and rye stooled readily during the damp cool weather, resulting in decided improvement. On account of the persistent low temperature, the growth of bluegrass, clover, alfalfa, and timothy depended more than usual on exposure and character of the soil. On the warmer limestone and sandy soils these crops, especially alfalfa, grew fairly well; but on the heavier and colder lands they remained dwarfed and backward. Potato planting and oats sowing were not completed until the last week. Many tobacco plant beds were sown after the 1st, which is much later than desirable. Plants came up during the last two weeks, but they grew very slowly. Because temperatures were too low to insure germination, farmers refrained from corn and cotton planting until late in the month, when a beginning was made in the southwestern counties. Planting became quite general in that section during the last week, but did not extend to the northern districts. Little attention was given to domestic gardens until the last week. Considerable new clover, killed by freezes late in March or early in April, was resown during the first two weeks. Only dry upland or hillside pastures furnished satisfactory grazing.

TEMPERATURE.

The average temperature for the State, based on reports from 44 stations, was 51.6°, which is 4.3° below normal and among the low records for April. Freezing temperatures were reported from one or more stations on 20 days. Minimum temperatures were not lower than often occur in April, but it was the persistence of low readings, maximum as well as minimum, that gave the month its inclement character. Extremes for the State were 87° at Bowling Green on the 30th and 16° at Farmers on the 29th.

PRECIPITATION.

The average precipitation for the State, 77 stations reporting, was 3.17 inches, which is 0.86 inch less than normal. It was heaviest in the extreme northern and a few western counties, where amounts ranged between 4.0 and 6.0 inches, and were somewhat in excess of normal at some stations. In the other agricultural districts from 2.0 to 4.0 inches occurred, while in the eastern mountain region the total was generally less than 2.0 inches. Light rain occurred on the 1st, 3d, 18-19th, 22d, 24th, and 28th; and moderate to heavy rains in the periods 6-9th and 11-13th. Snow flurries occurred at many northern and central stations on the 18th. Thunderstorms were reported on the 2d, 3d, 6th, 11th, 22d, 23d, and 28th. Light hail occurred at Blandville on the 23d. Precipitation extremes were 6.14 inches at Scott and 1.54 inches at Lexington.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, ", ', °, appearing in the table indicate number of days missing; for example, 2 represents two days, etc. §Lone Oak.

T Precipitation is less than 0.01 inch rain or melted snow.

† Also on other dates. †† Received too late to be included in means and summaries. ¶ Scott, Covington, Ky.

*Postoffice addresses — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Lock 13, Shelbyville, Ky.

MISCELLANEOUS.

April 23.—A residence was destroyed by fire resulting from lightning near Paris.

Rivers.—A moderate rise occurred in the Ohio during the second and third weeks, and in the Green on the 9th and 10th, otherwise stages were generally lower than usual in this month.

Error. Monthly mean maximum temperature at Harlan should be 47 2 instead of 47 1.

Daily Precipitation for April, 1926

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

* Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. ‡ Precipitation included in the next following measurement

; Separate dates of falls not recorded. T Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi

¶ Lone Oak

GENERAL SUMMARY.

Deficient moisture and wide variations in temperature rendered the month generally unfavorable for growth, hence most vegetation failed to make seasonal progress. Light frost in some northern localities on the 23d caused no damage. Weather conditions suitable for outdoor work, resulted in such rapid progress that the time lost in the preceding month was largely made up. Low temperature was the principal retarding element during the first two weeks, but late in the month drought assumed the most importance in that respect. The situation had become serious locally in the central and western counties when it was relieved by the heavy rains of the 31st. Plowing and planting proceeded at a highly satisfactory rate until the last week, when dry soil hindered or caused suspension of the work in most of the agricultural sections. Areas most seriously affected by the dry weather were the southwestern counties and the lower Green River Valley. In the eastern counties there was more rain and temperatures were not so high. The earlier corn and cotton germinated well, but later plantings came up irregularly or sprouted and perished. Because the soil was too dry to be worked, the completion of corn planting had to be deferred until after the rains. Tobacco plants, most of which were very small at the beginning of the month, were further delayed by the dry, cool weather. Early plants reached the size for transplanting during the last week, two to three weeks later than usual; and the rain on the last day enabled farmers to begin setting. Wheat, rye, barley, and alfalfa made much better progress than other crops. The rain came in time to fill out the wheat heads. Oats grew slowly but remained vigorous. Pastures began to deteriorate in the western districts during the last decade, but they continued good in the eastern counties. Although seed bluegrass headed and bloomed in the dry weather, the coming of the rains at the critical stage of its development assured a good crop of seed. Cultivation of early corn and cotton began late in the month. Both crops remained exceptionally clean, because the continued dry weather after the land was prepared prevented weeds from starting. Potatoes were much retarded, but were not generally injured. Early strawberries in the southern areas were dwarfed by drought.

TEMPERATURE.

The average temperature for the State, based on reports from 44 stations, was 66.2°, which is 0.6° above normal. Minimum temperatures slightly above freezing occurred at many stations on the 4th and at a few stations on the 23d. They registered between 40° and 45° on most days in the second decade. Maxima above 90° occurred generally in the western counties in the last week. Extremes were 101° at Murray on the 27th and 31° at Farmers on the 5th.

PRECIPITATION.

The average precipitation for the State, 80 stations reporting, was 2.36 inches, which is 1.61 inches less than normal, and the lowest record for May, except in 1891 and 1914. In the extreme northern and southeastern districts amounts ranged between 3.0 and 5.0 inches. In the central and southwestern counties from 1.0 to 3.0 inches occurred. In considerable areas along the Ohio and in the central counties the total for the month was less than 1.0 inch. Showers occurred mo[illegible] periods 3d-4th, 9-11th, 14-16th, 18-20th, and 30th-31st. Heavy rains were [illegible] general in the eastern districts on the 15th and 16th. Thunderstorms were reported on 11 days, accompanied by hail in many places. Precipitation extremes were 0.17 inch at Cloverport and 5.62 inches at Hazard.

[illegible] averages and extremes

[illegible] temperature data are taken from self-registering thermometers

[illegible] are compiled only for such stations as have ten or more years of record, but all complete reports are [illegible]

[illegible] Ashland, Beattyville, Berea, Brandville, Brooksville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

[illegible] ‡Hilltop, Bracken Co. †Lone Oak, Ky. ‡Locks Nicholasville Ky.: Lock 10, Red House, Ky.: Scott, Covington, Ky.

[illegible] ‡ Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

[illegible] Record for [illegible] published in weekly and monthly summaries. † Precipitation is less than 0.01 inch rain or melted snow

[illegible] Also on other dates. ‡ Record for [illegible] published in weekly and monthly summaries

[illegible] Lock 7, Lawrenceburg, Ky.; Lock 6, Carrollton, Ky.; Locks Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

[illegible] hail passed in a northeast-ly direction across the [illegible] northern edge of Carlisle County, and ended in [illegible] 1 to 5 miles wide, causing damage estimated at [illegible] baseballs, some disc-shaped like saucers, and some in icicle forms 5 to 6 inches long. were observed. Part of the damage was due to the wind carrying the stones against buildings.

May 17. Heavy hail caused damage estimated at $15,000 in the vicinity of Lexington.

May 17. The path of the storm was about two miles wide and six miles long.

May 20. Lightning killed a man in the open between two buildings near Winches-ter.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

† Separate dates of falls not recorded. T Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking (K) Kentucky (S) Salt (G) Green (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi. ‡ Cane Oak.

ter; wrecked a house and killed a child near Side View, and destroyed a store with a loss of $14,000 in Menifee County.

Moderate to heavy hail. Dix Dam, Hazard, Williamstown, 10th.

Rivers.—Except for a moderate freshet in the mountain streams on the 15th and 17th, stages were low during the month.

Errata.—April, 1926. Anchorage, partly cloudy days should be 2, cloudy days, 12. Berea partly cloudy days should be 14, cloudy days 12. Richmond, monthly mean temperature should be 52.0° instead of 52.2°. Lexington, maximum temperature on the 27th should be 67° on 28th 66°; mean maximum temperature should be 58.4° and mean monthly temperature 48.8°.

Daily Temperatures for May, 1926.

VOL. XXXI LOUISVILLE, KY., JUNE, 1926. No. 6

GENERAL SUMMARY.

Except for a few days in the second week, temperatures averaged almost continuously below normal and were generally unfavorable for the growth of warm weather crops. The corn crop, already delayed by late planting, made less than normal progress. The cool weather was favorable for transplanting tobacco, resulting in a better stand than is usually obtained in warm Junes. During the first two weeks sufficient rain occurred in all districts to enable farmers to set tobacco, and most of this work was done within that period. There were extraordinary contrasts in precipitation, some districts receiving plenty of rain while others suffered from more or less severe drought. In the south-central counties, including the southern bluegrass region, precipitation was sufficient for the needs of all crops. Within this district the progress of corn, tobacco, and forage crops was satisfactory. In the area outside of this moist region, including most of the immediate Ohio Valley, the Purchase, and bordering counties to the eastward, the Big Sandy Valley, and the southeastern mountain region, vegetation suffered for moisture, and some crops such as potatoes, truck, timothy, and oats were seriously injured and reduced in yield. Raspberries dried on the bushes and gardens supplied few vegetables. In the dry districts the effect of the weather on tobacco and corn was mainly to prevent seasonal growth and to cause marked irregularity in size of plants. Wheat matured and ripened rather slowly but in excellent condition, and harvest proceeded rapidly during the week. In the extreme western counties the size of heads had been somewhat affected by the continued dry weather. Cotton made fair progress, delayed somewhat by the cool weather, but it was not hurt by the drought. Except in a few localities, principally in the Green River Valley, where local rains interfered, corn and tobacco were exceptionally clean and well cultivated.

TEMPERATURE.

The average temperature for the State, based on the reports of 42 stations, was 70.9°, which is 3.0° below normal. Minimum temperatures below 50° occurred at many stations in the periods 5-7th and 27-28th. They were below 60° on many days, especially in the northern and eastern counties. Maximum temperatures seldom reached 90°. The highest was 98° at Hopkinsville and Murray on the 13th and at Bowling Green on the 17th; and the lowest 42° at Junction City on the 6th.

PRECIPITATION.

The average for the State, 81 stations reporting was 3.44 inches, which is 0.65 inch less than normal. The distribution exhibited remarkable contrasts. In the district between the middle Green River Valley and the western edge of the mountains, amounts ranged between 4.0 and 9.0 inches at most stations. A small area in the Lower Licking Valley also received over 4.0 inches. In other districts precipitation varied generally between 1.0 and 3.0 inches, being lightest near the Ohio and Mississippi rivers. Heavy rains occurred quite generally on the 1st, and locally in the central counties on the 13th, 18th, and 22d. There were local showers in the periods 4-7th, 12-15th, and 18th-22d. Practically all rain attended thundershowers, which occurred almost daily in some parts of the State. Precipitation extremes were 0.86 inch at Louisville and 9.29 inches at Munfordville.

MISCELLANEOUS.

June 12.—Squalls attending thunderstorms caused much damage to buildings, timber, crops, and wire systems in Mercer, Woodford, and Fayette counties.

Rivers:—Except for freshets in small streams caused by local rains, particularly in the upper Green River Valley, stages were low during the month.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. * Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶ Postoffice addresses: Lock 2, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky. §Lone Oak.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., JULY, 1926. No. 7

GENERAL SUMMARY.

Although temperatures averaged near normal, there were marked periodical variations above and below that point. A decade of high temperature at the beginning, favorable for corn in those districts where moisture was sufficient, was followed by a week of decidedly cool and less favorable weather, after which temperatures nearer the seasonal average prevailed. Extraordinary variations in precipitation caused exceedingly divergent crop conditions. In general sufficient precipitation for the needs of the crops occurred in the eastern half of the State and also in some central counties. Corn and tobacco made normal progress in that section, and to some extent made up arrears in seasonal advancement. Tobacco remained backward, however, because of late setting. In the western half, particularly the immediate lower Ohio Valley below the mouth of the Kentucky, drought became worse and spread in more or less spotted and irregular fashion over the central counties. In the drier districts corn deteriorated, even in the bottoms, because of "firing", curling, and tasseling without shoots. It suffered to a lesser degree, especially on the uplands, in practically all of the western section. The growth of tobacco, already behind on account of late setting, was much retarded, resulting in decided irregularity in the size of plants. Good rains in the last week relieved the drought and started vigorous growth in most of the dry section. Except in a limited area near the lower Ohio, which received only moderate showers, corn and tobacco were growing rapidly at the end of the month. The extensive root systems developed during the drought contributed largely to the rapidity of growth that followed the rains. The dry weather prevented the planting of most late potatoes in the western counties until after the rains. Gardens suffered severely or made fair progress, varying in condition with the precipitation. The weather was generally favorable for hay and oats harvest, and for threshing. The quality of grain was fine and the yield exceptionally good. Pastures practically dried up in the western counties, but continued fairly good eastward. An unusually fine crop of bluegrass seed was gathered, cured, and cleaned under favorable weather conditions. The dry, cool weather retarded the growth of cotton, but it suffered little otherwise and began to set bolls before the end of the month.

TEMPERATURE.

The average temperature for the State, based on reports from 44 stations, was 77.6°, which is 0.7° above normal. Maxima of 100° or higher occurred at many central and western stations in the periods 2d-5th and 19th-23d. Minima below 50° were registered generally on the 15th, and below 60° from the 11th to 18th. Extremes for the State were 107° on the 3d at Hopkinsville and 43° on the 15th at Middlesboro.

PRECIPITATION.

Based on reports from 81 stations, precipitation for the State averaged 4.36 inches, which is 0.19 inch above normal. In the extreme northeastern counties, the central bluegrass region, and most of the mountain section, also in a few central localities, monthly amounts ranged between 4.0 and 7.0 inches, while a few stations reported from 8.0 to 10.0 inches. In most central and western districts they ranged between 2.0 and 4.0 inches, but less than 2.0 inches occurred in the districts near the lower Ohio river below the mouth of the Salt. Another dry area in the south-central counties received only about 2.0 inches. Local showers were reported on nearly every day from the 1st to the 14th and from the 22d to 31st. Rains were

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, ', ", °, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries.
¶ Post office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.
The departures (from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are
‡ Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
§ Lone Oak.
† Precipitation is less than 0.01 inch rain or melted snow.

fairly general, and in some cases excessive in the period 26.28th. Most of the rain attended local thunderstorms, some of which caused considerable damage from lightning and windsqualls. Precipitation extremes were 0.83 inch at Paducah and 10.72 inches at Hazard.

MISCELLANEOUS.

July 6.—Extensive damage to crops, buildings, and wire systems, due to wind, lightning, and excessive rains occurred in the bluegrass region. The loss in Bourbon County was estimated at $40,000 and in Campbell County at $50,000. One

Daily Precipitation for July, 1926.

VOL. XXXI LOUISVILLE, KY., AUGUST, 1926. No. 8

THE LIBRARY OF THE
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

Daily mean temperatures near normal favored crop development; but an excess of moisture in most districts, with persistent cloudiness tended to delay maturity, and cause sappy conditions with large growth of foliage. [illegible] most districts in the first decade were followed during the next two weeks by heavy showers of almost daily occurrence. In the western counties, all crops were stimulated to rapid growth and made extraordinary progress, especially late corn and tobacco, which had been delayed and dwarfed by the drought. In the eastern counties late crops also profited by the rains; but the excess of moisture and the frequency of showers caused damage to grain, mainly oats, in shock, resulted in stalk rot and spread of rust on tobacco, delayed field work, and caused suspension of fall plowing. Corn in bottoms was damaged by overflow of streams and some corn felt in the softened fields under the influence of local wind squalls. In general, however, the corn crop on well-drained soil, even in the wettest localities, made excellent progress. Early tobacco ripened very slowly, and cutting had barely commenced at the end of the month, prompted generally by fear of rust damage. Topping of late tobacco was mainly completed during the last week. Growth had been so rapid, due in part to the large root systems developed during the dry weather, that most plants had reached fairly good size. Rust and stalk rot were checked by the fine weather of the last week. It was also possible to resume fall plowing. Melons and cannery tomatoes were injured by the continued rains. Cowpeas and soybeans grew rank and pods decayed to some extent. Alfalfa and clover revived and made good growth, but seed clover largely failed to fertilize. Cutting of the third crop of alfalfa was delayed about two weeks. Fungus diseases on fruit seemed to be worse during the rainy weather, causing much loss; while picking and marketing were rendered difficult. Except for the tendency to grow somewhat rank, cotton made good progress. Bolls began opening only a few days later than the average date.

TEMPERATURE.

The average temperature for the State, determined from reports of 45 stations, was 77.3°, which is 1.7° above normal. There were two short periods of moderately cool weather, otherwise daily averages were generally above normal. Minimum temperatures were higher and the nights were warmer than usual in August. Extremes for the State were 101° at Glasgow on the 6th and 51° at Middlesboro on the 26th.

PRECIPITATION.

Precipitation for the State, based on reports from 81 stations, averaged 7.51 inches, which is 3.80 inches above normal and the heaviest for August since State records were established. Rain occurred in most districts in the periods 1st-3d, 7th, 30th-31st; and daily in some part of the State from the 12th to 25th. It was especially heavy locally on the 1st, 15-19th, and 24th. Distribution over the State was quite irregular. In most of the southern counties amounts ranged between 8.0 and 12.0 inches. In the bluegrass region and the north-central counties, the range was generally from 6.0 to 9.0 inches. Near the eastern boundary and about the lower Green, from 4.0 to 6.0 inches occurred. Extremes for the State were 12.63 inches at Princeton and 2.26 inches at Sergent. Thunderstorms were frequent, but were not often attended by destructive lightning.

State averages and extremes

All temperature data are taken from self-registering thermometers.

The departure from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining the section or division means.

Reference letters, as a, refer to notes appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. † Records too late to be included in means and summaries.

‡ Post office at Pleasureville. § Lone Oak.

‖ Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

Kinney, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

T Precipitation is less than 0.01 inch rain or melted snow

MISCELLANEOUS.

Aug. 17.—Excessive rains caused extensive damage by washing out bridges and culverts and flooding bottoms in the northern and western counties.

Aug. 23.—A woman was drowned by the sudden rising of a creek near Frankfort. A boy was killed by lightning near Middleburg.

Daily Precipitation for August, 1926

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

c Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Rivers.—Low stages prevailed in the Ohio during the first two weeks, after which a sharp rise that culminated in the lower section on the 25th resulted in stages of 25 to 35 feet at most stations along the border of this State. The upper Green was moderately high on the 20th and the upper Cumberland on the 26th.

Errata.—June, 1926, precipitation, greatest in 24 hours, Beattyville, 0.84, 15th; total, Hopkinsville, 2.74; prevailing direction, Russellville, south. July, 1926, mean temperature, Ashland, 76.9; total precipitation, Mayfield, 1.59; prevailing direction, Hopkinsville and Shelbyville, south.

Daily Temperatures for August, 1926.

NOV 4 1926
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

Mean daily temperatures above normal during three weeks vored the growth of retarded crops in the western counties d hastened maturity in the eastern counties. Much cloudi- ss, with frequent showers and often heavy to excessive rains, terfered greatly with outdoor work, particularly tobacco arvest. Early tobacco ripened normally, but the rains delayed tting from a week to ten days. In the second decade, which as fairly dry, the work of caring for this crop was pushed with e utmost speed, and tobacco housed at this time began curing asonably well. In the last decade, however, almost daily owers rendered the work of cutting and housing exceedingly fficult, and resulted in tobacco being placed in barns in un- tisfactory condition. Under these circumstances there was me sweating, but an occasional dry day with sunshine inter- ersed at critical intervals, largely checked such tendencies and evented serious injury. Late tobacco developed rapidly but pened slowly. Practically all Burley had been saved at the se of the month, but a small percentage of the crop remained the field in the Dark district. Except on a few days early rn dried very slowly. Its sappy condition and the prevailing mp weather caused cutting to be delayed as long as possible. here was fairly good progress with silo filling. Most late corn s safe from frost at the end of the month. In the second cade the weather was mostly favorable for curing late hay, t rains caused injury at other times. Late white potatoes d sweet potatoes suffered from lack of sunshine. Cannery matoes rotted seriously, and were reduced in yield because of lure to set fruit in the rainy weather. Cotton grew rank and ening of bolls was delayed. Plowing made some progress, nerally better in the southwestern counties where the rains re lighter and less frequent; but late in the month it was spended because of rain or deferred in order to care for the bacco crop. Less than the usual amount of rye was sown, rgely because of the luxuriant condition of pastures. Fruit s picked and marketed with some difficulty and with more an the usual loss.

TEMPERATURE.

The average temperature for the State, determined from the ports of 43 stations, was 73.5°, which is 3.2° above normal. xcept for a sharp cool wave from the 25th to 28th, mean mperatures were near or above normal and minima generally derate or fairly high for this month. Extremes for the ate were 98° on the 17th at Murray, and 40° on the 26th at ott.

PRECIPITATION.

Precipitation for the State, based on reports from 80 stations, eraged 3.78 inches, which is 0.97 inch above normal. Except the western counties, where showers were somewhat scattered, n occurred quite generally in the period 1st-6th. From the d to 30th rain was also general on most days, and frequently avy to excessive. Local downpours caused some injury to ps. Marked irregularity prevailed in areal distribution. In e central and extreme northern counties amounts ranged tween 4.0 and 6.0 inches at most stations. In the western rision and the eastern mountain section they were generally less than 3.0 inches, and at a few stations less than 2.0 inches. Extremes for the State were 7.31 inches at Quicksand and 1.18 inches at Pikeville.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

*Also on other dates. **Received too late to be included in means and summaries.

¶Post-office addresses: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS,

Sept. 24.—Heavy hail damaged late corn and tobacco in a narrow strip near Sandersburg, Fayette County.

Rivers.—Rains of the first and last weeks caused rises to moderate stages in the Ohio. The Mississippi along the western border was relatively higher than the Ohio during the last three weeks.

Daily Precipitation for September, 1926.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., OCTOBER, 1926. No. 10

GENERAL SUMMARY.

The temperature averaged somewhat above normal, but daily means were variable with rather sharp departures at the beginning and near the close. Killing frost in the northern and eastern counties from the 25th to 27th caused no damage of consequence. Frequent and heavy precipitation rendered all work difficult and caused serious delay. Even in the short periods when weather conditions were most favorable, there was much cloudiness with prevailing high humidity, so that corn and tobacco dried very slowly and the soil remained heavy. Except on a few days rain largely prevented corn cutting and silo filling. Complaint of damage in shock, due to the persistent dampness, continued during the month. Even in standing corn drying was so delayed that no gathering was attempted except in the extreme western counties. Cutting and housing tobacco were mainly completed in the first week, with the weather warm, showery, and decidedly unfavorable for curing. More or less sweating in barns was reported, especially from the northern and central districts. Conditions for curing were somewhat better in the southwestern counties, where there was more sunshine and less rain. Wheat sowing became general in the second week, and proceeded intermittently until about the middle of the month, after which the soil was too wet to be worked on most days. In some localities the sowing of fall grains had been scarcely more than half completed at the end of the month. Wheat and rye came up to good stands and grew rapidly, in some cases becoming too advanced. Pastures continued luxuriant, but the turf became soft on account of frequent soakings. Sweet potatoes and late white potatoes suffered from lack of sunshine. Slow growth continued during the month, with variable results in yields and unfavorable conditions for digging and drying at the end. There was little favorable weather for saving late hay and practically none in which curing could be thorough. The late growth of clover, timothy and alfalfa, was much more vigorous than usual, although tending to rankness and succulence in the absence of sunshine.

TEMPERATURE.

The average temperature for the State, determined from reports of 43 stations, was 59.3°, which is 1.2° above normal. The month began with a marked warm wave in which maximum temperatures reached 90° at many stations and daily averages were 10° to 15° above normal. The coolest weather of the month occurred in the period 24-27th, when averages were 10 to 20 degrees below normal at most stations. Extremes for the State were 94° on the 1st at Murray, and 25° on the 27th at Middlesboro and on the 27th at Shelbyville.

PRECIPITATION.

Precipitation for the State, based on reports from 79 stations, averaged 5.96 inches, which is 3.36 inches above normal. Except in the western division, where rain was somewhat less frequent, showers occurred daily and quite generally in the periods, 1st-5th; 10-13th, 20th, 23d-26th, and 29th-31st. Except on the 7th and 8th, rain was reported from some part of the State on every day. Rains were heavy locally on the 5th, 19th, 20th, 24th, and 31st. In a broad belt through the central counties from the Green River basin to the lower Big Sandy, and in the section to the northward, monthly amounts ranged generally between 6.0 and 9.0 inches. In the southeastern and extreme western counties they ranged between 3.0 and 5.0 inches. Extremes for the State were 9.60 inches at Salvisa, Mercer County, and 2.12 inches at Pikeville. Snow flurries were reported from northeastern stations on the 25th.

MISCELLANEOUS.

Oct. 4.—Some damage was caused by a local windstorm at Cloverport.

Floods.—Sharp rises in the Ohio River during the 2d and 4th weeks caused moderately high stages. The Mississippi alon the western border reached exceptionally high fall stages, lack ing but few feet of flood stage and causing considerable damag to lowland crops.

Daily Precipitation for October, 1926.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., NOVEMBER, 1926. No. 11

THE LIBRARY OF THE
JAN 5 1927
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

The temperature was quite changeable, but averaged considerably below normal. Brief intervals of moderate weather alternated with extended periods of marked but somewhat irregular temperature deficiency. The cold, cloudy, windy weather that predominated rendered the month disagreeable and generally unfavorable for outdoor work. As a result there was much delay in farm activities. This was especially serious with respect to corn, because the bad condition of the shocks and the large amount of fallen corn made speedy gathering very desirable. There was some improvement in shocked corn during the first week, but little change thereafter. Gathering revealed that a larger percentage of the crop than usual had been damaged by excess moisture. In the week ending on the 23d the weather was particularly inclement, with hard freezes nearly every night and considerable snow in the central and southern counties. Following the snow temperatures on the 22d fell nearly to zero at several central stations. During the lowest temperature there was some snow cover in most of the State. Apparently the freezes caused no injury to grains. Although the aggregate precipitation was near normal, its frequency, together with the low temperature, freezing, and thawing, kept the surface soil very wet and hindered the removal of husked corn from the fields. Drainage improved slowly toward the end of the month. Wheat sowing continued for a few days after the 1st, finally ceasing without being completed because of wet soil and the late date. Except for a brief dormant period during the cold week, wheat and rye continued to grow slowly. Early wheat which was generally in excellent condition, made up less than the usual part of the acreage, owing to the difficulty experienced in sowing at the proper time. Late wheat came up well, but a large part of it showed only one leaf at the end of the month. Though low temperature prevented much growth of grass, pastures remained in excellent condition from the preceding month and continued to furnish good grazing. For this reason stock required only light feeding. Gravel roads deteriorated and dirt roads became very bad.

TEMPERATURE.

The average temperature for the State, 44 stations reporting, was 42.9°, which is 3.4° below normal and among the low records for this month. Except for a few warm days, the first three weeks were unseasonably cold, with mean temperatures frequently 10° to 15° below normal and minima below freezing. The last week was generally mild and favorable. Temperature extremes were 80° on the 14th at Dix Dam and zero on the 22d at Glasgow

PRECIPITATION.

Precipitation for the State, based on reports from 81 stations, averaged 3.40 inches, which is 0.13 inch below normal. It occurred generally in the periods 9-10th, 15-18th, 21st, 25-27th, and 29-30th. Heavy local rains were reported on the 9th, 15th, 16th, and 26th. Snow, ranging in depth from 1.5 to 4.0 inches, occurred in the central counties on the 21st. It was generally lighter, varying from a trace to 1.0 inch in the extreme northeastern counties and along the southern border. Total precipitation ranged between 1.5 and 3.0 inches in the northeastern districts, and from 3.5 to 5.0 inches in central and southern sections. The extremes were 5.57 inches at Junction City and 1.23 inches at Lockport, Henry County. Thunderstorms occurred at several stations in two periods, one immediately following the middle of the month and one near the close.

State averages and extremes.

‡Temperature data are taken from self-registering thermometers. Precipitation data are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

[a] Departures from normal temperature and precipitation are Locks on the Green River; other Locks are on the Kentucky River. [b] Records for less than 10 years. [c] Runsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River. [d] Represents two days, etc.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [a] represents two days, etc.

‡ Received too late to be included in means and summaries. § Lone C

* Also on other dates. † Precipitation is less than 0.01 inch rain or melted snow.

¶ Destroyed by sickness. — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

Rivers:—Stages in the Ohio River were somewhat higher than usual in this month. Heavy precipitation in the upper basin on the 16th caused a rather sharp rise during the following w

Errata for October, 1926. Elkhank, days with precipitation, .01 or 7 instead of 6. Princeton, prevailing direction of wind S. instead of N.

Daily Precipitation for November, 1926.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXI LOUISVILLE, KY., DECEMBER, 1926. No. 12

GENERAL SUMMARY.

Variable temperatures, with little sunshine and much wind, rendered the month disagreeable and unfavorable for the usual outdoor activities. Precipitation was relatively light in the first two decades and heavy to excessive in the last. Except for about a week of fair weather near the middle of the month, when the soil was hard frozen, conditions were decidedly unfavorable for moving corn and fodder out of fields. Even in this period the prevailing low temperatures were a hindrance to gathering corn. During the rainy spell later in the month, this work made no progress of consequence. As a result of the continued interference by unpropitious weather, it is estimated that at least one-third of the corn crop remained in the field at the end of the month. Deterioration of corn in shock and on the ground continued, especially in the frequent brief periods when temperatures rose above normal. The soaking rains late in the month saturated and settled the shocks and caused more standing corn to fall. Slow growth of winter grains continued at intervals in the first decade, but later on the plants were generally dormant. On account of the saturated condition of the soil, the freezes caused some lifting, but in general early sown wheat and rye remained in good condition. Late sown grains did not look so well, and seemed to suffer more from the freezes. Frequent periods of dampness favored handling tobacco, but dirt roads in exceedingly bad condition hindered marketing. Pastures furnished some grazing in the first half of the month, but full feeding was required in the last half. Floods in all streams of the State, caused by the excessive precipitation in the last decade, damaged lowland crops and carried away considerable corn.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 37.8°, which is 0.2° above normal. In the first half of the month low and high temperatures alternated in periods of one to three days each. Rather sharp cold prevailed from the 14th to 18th, when minima ranging between 5° and 10° were registered at most stations. Extremes for the State were 75° on the 13th at Williamsburg, and 5° on the 16th at Hindman.

PRECIPITATION.

Precipitation for the State, based on reports from 80 stations, averaged 6.01 inches, which is 1.93 inches above normal. Light to moderate and generally local precipitation occurred in the period 5-13th. Moderate to excessive rains occurred almost daily from the 20th to 29, inclusive. In the south-central border counties and eastward in the southeastern mountain region, the total for the month ranged between 9.0 and 11.0 inches, about three-fourth of which occurred in the decade beginning with the 20th. In the remainder of the southern half of the State, amounts ranged from 6.0 to 9.0 inches. Precipitation diminished rapidly toward the Ohio River, varying generally between 3.0 and 5.0 inches in the northern counties. Eastern stations, mainly in the mountains, reported from 1.0 to 4.0 inches of snow. Precipitation extremes were 2.73 inches at Lockport, Henry County, and 11.31 inches at Burnside. The freezing and thawing, together with the heavy rains, caused marked injury to macadamized roads.

MISCELLANEOUS.

Dec. 25.—A sleet and ice storm caused much damage to [illegible] and wire systems in the northern and western counties.

Floods.—Heavy rains on the 21st and 22d caused freshets in headwater streams that in some cases produced record [illegible]

† Lowest on record. ? Record incomplete. ‡ Lone Oak.

V. Observations: Data are taken from self-registering thermometers.

Precipitation: The records from several localities are incomplete, owing mainly to the breaking of rain gauges by ice. Discrepancies between the Greenville, Paducah, and Woodbury records and those in the Ohio River and other Locks are due to the Kentucky River and to the omitting of rain or melted snow [illegible] Between dates, 5, 6, 7, appearing in the table indicate rainfall on the days missing for exposure; as in exposures two days, etc.

Barometer indexes, 5, 6, 7, appearing in the table indicate readings on days missing for exposure; as in exposures two days, etc. T. Precipitation is less than 0.01 inch rain or melted snow ‡ Lone Oak.

* Approximate dates. ? Record incomplete or estimated and [illegible]

§ Record of rainfall was interrupted by frozen conditions.

Hours of observation.

(7-8 a. m. on mark-ed.) Regular Weather Bureau stations; precipitation is for fixed hour period, midnight to midnight.

Precipitation observed in the morning; amount recorded is for the preceding 24 hours. * Precipitation observed in the next following observation.

; separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

In southeastern Kentucky was interrupted in many places. Parts of Corbin, Pineville, Harlan, Hazard, and other mountain towns were flooded. No accurate estimate of damage could be obtained, but it is believed to exceed $100,000 in the entire district. The lower Cumberland was in flood and still rising at the close of the month.

Errata for November, 1926. Anchorage: clear, 11; cloudy, and cloudy days, December 10-14-6, should be 10-14-5. Brandenburg: clear, 9; cloudy, and cloudy days, December 9-13-8, should be 9-12-9. Owensboro: clear, 11; cloudy, and cloudy days, December 7-7-16, should be 8-8-14.

Daily Temperatures for December, 1926.

VOL. XXXI LOUISVILLE, KY., ANNUAL, 1926. No. 13

GENERAL SUMMARY.

The special features of the year's weather were the precipitation deficiency in the first six months; the cold spring and early summer; the persistent rains in late summer and autumn; and the abnormal cloudiness in the last five months. Although the temperature for the year averaged near normal, decided periodic irregularities appear in the records of most months. Except for a warm February, temperatures below normal predominated in the first half of the year. March was colder than February, and the April mean ranked among the low records for that month. The low temperatures, continuing through the first half of May, delayed planting and caused vegetation to start slowly. Precipitation was below normal in every month from January to June, inclusive. This was favorable for winter grains, grass, and clover, since the well drained condition of the soil reduced to a minimum the injury by lifting freezes. With the advent of summer and the increasing dryness of the soil, plowing became difficult, germination uncertain, and growth irregular. Dwarfing tendencies appeared in corn, potatoes, oats, gardens, and small fruits. The crops of quick development, such as potatoes, oats, and strawberries were seriously injured. By the end of May well defined drought conditions existed in the western counties. Pastures deteriorated, and even deeply rooted forage crops were affected. The backwardness of corn and tobacco indicated late maturity for a large proportion of both crops. This was more serious in the western than in the eastern counties. From late in July to October, inclusive, temperatures above normal and frequent, often excessive, rains changed entirely the character of the season. Belated crops revived; and, owing to the late date of killing frost, mostly matured in time. Persistent rains in August, September, and October interfered with harvesting the crops and caused considerable damage. Tobacco in barns was injured by sweating, while corn in shock dried too slow and molded extensively. In October the soil was almost continuously too wet for seeding, therefore completion of this work was not possible within the usual period. A large proportion of grain was sown late. November and December were cold, cloudy, wet, and generally unfavorable. Corn gathering progressed haltingly because of muddy fields and frequent spells of inclement weather, while shocked and fallen corn continued to deteriorate. The dampness was favorable for handling tobacco. Heavy rains in the latter half of December caused disastrous floods in headwater streams.

The Weather By Months.

JANUARY.—Temperatures were variable and precipitation was irregularly distributed. Two cold waves brought temperatures near zero to most districts. Warm spells caused complete thaws that resulted in damage to roads. Winter grains were protected by snow during a part of the cold weather, especially in the eastern counties.

FEBRUARY.—Frequent sharp changes in temperature, with deep thawing followed by lifting freezes, caused some damage to winter grains and clover. Temperatures averaged above normal, but the quick changes to colder kept vegetation generally dormant. Although frequent, precipitation was below the seasonal average.

MARCH.—In the main the month was unseasonably cold and persistently unfavorable for outdoor work. Vegetation remained backward and but little planting was done. Because of the light precipitation, the better soils remained well drained and grains were only slightly damaged by freezes.

APRIL.—Temperatures almost continuously below normal retarded growth and caused much planting to be deferred. Fruit buds were damaged by freezes. Rains delayed plowing in some northern districts, but the light to moderate precipitation did not impede farm work in other sections.

MAY.—Low temperatures during the first two weeks continued to hold back vegetation, but late in the month drought became the most important retarding feature. Dry soil hindered plowing and planting, and interfered with germination of seeds planted late in the month.

JUNE.—The month was generally unfavorable for warm weather crops. Most tobacco was transplanted in the first two weeks. Except in the south-central counties precipitation was deficient, and crops of quick growth were seriously injured by drought. Wheat made satisfactory progress, but ripened somewhat late.

JULY.—Drought became worse, with marked deterioration of crops, in the western half of the State. Good rains in the last week relieved the drought in most districts. Precipitation was generally sufficient in the eastern counties.

AUGUST.—Temperatures were favorable, but excessive moisture and persistent cloudiness delayed maturity of crops in northern and eastern districts. The rains were generally beneficial in the drier western localities. Pastures became fine.

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.
† Also on other dates.

SEPTEMBER.—Temperatures above normal favored the growth of retarded crops; but frequent and heavy rains interfered with outdoor work, especially harvesting tobacco. Late crops grew very sappy and matured slowly.
OCTOBER.—Conditions rains delayed fall work. With the soil generally too wet, preparation of fall grains went on intermittently. Pastures continued in luxuriant condition. Late vegetables suffered from lack of sunshine and excessive moisture.

NOVEMBER.—Temperatures were changeable but generally low. Cloudy, windy, rainy weather, rendered the month unfavorable for outdoor work. Corn was seriously damaged in shock, and gathering was much delayed.
DECEMBER.—Heavy rains in the latter half caused serious floods in all streams of the State. Corn gathering was delayed and damage in shock continued. The damp weather favored handling tobacco.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining ction or division means. T Precipitation is less than 0.01 inch rain or melted snow.

†Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Monthly and Annual Mean Temperatures for the Year 1926, with Departures from the Normal.

All temperature data are taken from self registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

NOTE.—Tables and charts giving climatic data for Kentucky in detail during 1926 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in charge at that office. Indexes to special articles published during past years in Kentucky climatological reports will be found in the Monthly Report for June, 1909.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., JANUARY, 1927. No. 1

GENERAL SUMMARY.

With the exception of a few days, decidedly cold weather prevailed during the first two weeks and abnormally warm weather in the last two. The same contrast appears in precipitation, which was light in the first half, but excessive and frequent in the last half. Floods in most streams of the State overflowed lowlands during the third week, and were still in progress in the western counties at the close of the month. Wheat, rye, grass, clover, and alfalfa on overflowed lands were damaged, particularly along the Cumberland, Green and lower Ohio Rivers. Corn gathering continued in the cold dry period, hindered somewhat at times by low temperature; but outdoor work ceased with the beginning of the rainy spell. Corn remaining in shock during the rains suffered further deterioration. Rarely have conditions been so persistently unfavorable and difficult for gathering this crop as during this winter. Wheat and rye on well drained uplands continued generally in good condition. Probably less than the usual amount of damage occurred from freezing and thawing, due to the mild temperature in most of the period when the soil was super-saturated. There was some light snow cover in the northern counties from the 9th to 12th. The dry cold of the first half interfered with handling tobacco, but the weather was almost continuously favorable later on. Tobacco stripping progressed rapidly at this time, but persistent downpours of rain and the condition of the roads hampered deliveries. Macadamized roads, softened by the general thaw and drenched by excessive rains, suffered extensive injury under the heavy hauling. Dirt roads became almost impassable. The month ended warm, with grass and winter grains showing signs of growth and the buds of some trees and shrubs beginning to swell.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 35.8°, which is slightly above normal. Temperatures below normal were almost continuous from the 7th to 16th, with the exception of two days, they were above normal from the 17th to the end of the month. Minima near zero were registered generally on the 15th, and maxima ranging from 60° to 75° on the 22d, 26th, and 30th. The extremes were 76° at Urgent on the 21st, and −3° at Eubank on the 16th.

PRECIPITATION.

Precipitation for the State, based on reports from 79 stations, averaged 6.33 inches, which is 1.95 inches above the January normal. Light snow occurred on the 9th and 10th and light rain, irregularly distributed, on the 13th and 14th. Except in the southeastern counties, moderate to heavy rains were general over the state from the 18th to 24th, and also in the central and eastern counties in the period 29th-31st. The total precipitation for the month ranged from 9.0 inches in the western counties to 2.5 inches near the southeast border. Excessive rain, ranging from 7.5 to 9.0 inches, prevailed over a large area extending from the Purchase to the bluegrass region. Precipitation extremes were 1.87 inches at Hazard and 9.55 inches at Rumsey. Snowfall ranged between 1.0 and 4.0 inches in the northern and central districts. A few central stations reported thunder on the 21st.

MISCELLANEOUS.

Jan. 22d and 23.--An ice storm in the northern and western counties caused extensive damage to wire systems, especially from Paducah westward.

PRESSURE AND WIND.

State averages and extremes.

A dagger (†) appearing in the table indicates number of days missing, for example, 5 represents two days, etc.

Reference letters, a, b, c, etc., appearing in remarks and summaries indicate that data are included in means and summaries for the following stations:

‡ Also no other dates. ** Received too late to be included in means and summaries. †† Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

¶ Post office addresses. Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

a 23d and 25d. — At the storm in the northern and western counties caused exten-

b — age to wire systems, especially from Paducah westward

c — The Ohio after flood crested in the lower reaches of the Green on the 4th,

d — on the 5th, and 6th, the Cumberland on the 5th, and in the Ohio from the

e — 7th. In the lower Tennessee, Cumberland and Green crests were about four to seven feet

f — above flood stage, and in the lower Ohio they were about four to seven feet

g — Excessive rainfall the period 18th-23d caused floods in all streams of the State,

h — the Ohio from the mouth of the Big

a 23d and 25d. — At the storm in the northern and western counties caused exten-

b — age to wire systems, especially from Paducah westward

c — The Ohio after flood crested in the lower reaches of the Green on the 4th,

d — on the 5th, and 6th, the Cumberland on the 5th, and in the Ohio from the

e — 7th. In the lower Tennessee, Cumberland and Green crests were about four to seven feet

f — above flood stage, and in the lower Ohio they were about four to seven feet

g — Excessive rainfall the period 18th-23d caused floods in all streams of the State,

h — the Ohio from the mouth of the Big Sandy to Evansville, this flood eliminated between the 26th and 31st, with crests five to ten feet above flood stage and the highest since 1913. It continued in the lower Cumberland at Eddyville, 68.5 ft. on the 5th, is the highest of record. This flood crested in the upper Cumberland at the close of the month. The crest in the lower Cumberland reached flood stage 22d to 26th, at 6.9 to 9.0 feet above flood stage. The Green and Barren reached crests in the second flood of 6.0 to 14.0 feet above flood stage from the 24th to 31st. The lower Kentucky was slightly above flood stage on the 23d.

Daily Precipitation for January, 1927.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

? Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Considerable losses resulted from flooding of growing crops, the carrying away of stored crops and other property, and the flooding of buildings with damage to goods and furniture. Highways and railroads were flooded in places causing suspension of traffic. Reports from the lower Cumberland place the total loss near $50,000. Along the Ohio it is estimated at $65,000. The loss in the flood early in the month in western Kentucky is estimated at $500,000. Most of these losses were due to the carrying away of corn that had not been gathered because of the wet weather.

Errata for December, 1926.

Lexington. Maximum temperature 2d 37, instead of 44; 4th 54 instead of 58; 5th 58 instead of 57; 20th 28 instead of 29; mean maximum 42.0 instead of 42.4. Minimum temperature 20th 30 instead of 23; 25th 25 instead of 29; mean minimum 27.9 instead of

Daily Temperatures for January, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

XXXII LOUISVILLE, KY., FEBRUARY, 1927. No. 2

GENERAL SUMMARY.

e average temperature for the month equaled the highest cord. The prevailing warm weather caused grasses and r grains to begin growing. Peach buds expanded until showed color, and some shrubs began putting out leaves. condition of plant activity was similar to that usually ob- d a month later. A few periods of subnormal temperature o to three days duration, accompanied on the 10th and th by considerable snow, were timely and beneficial in ing premature growth of vegetation. The temperature s was greatest in the southern and western counties, where anxiety prevailed in regard to the fruit crop. Wheat, clover, alfalfa, and bluegrass on warm well-drained soils a good start. These crops emerged from the winter in condition, with a minimum of damage from lifting freezes. was some snow cover from the 19th to 21st, but as a rule now melted off soon after it fell. Although precipitation ess than the normal amount, its frequency kept the soil ally too wet to be worked. A little plowing was accom- d in the southwestern counties, otherwise outdoor work e farm was limited to the usual midwinter activities, or owing of a few tobacco plantbeds toward the end of the n. Roads improved slowly because of the relatively light pitation and absence of deep freezes, but continued gener- n bad condition. The mild weather favored the handling acco, which could readily be stripped and moved to market ctically any time in the month. Except during the few days stock, especially young lambs, fared much better usual in this month. The mild weather had a marked in increasing the egg supply, with a consequent reduction ce.

TEMPERATURE.

e average temperature for the State, 42 stations reporting, 5.6°, which is 9.6° above normal and the same as the average for February, 1890. In the long periods of high rature the excess of the daily average above normal ranged 10° to 25° on many days. Temperatures somewhat below l occurred in the periods 10-11th, 19th-21st, and 26-28th. na ranged from 70° to 80° on several days. Minima, n the colder periods, were exceptionally high. Extremes 81° at Hopkinsville on the 17th, and 15° at Greensburg wensboro on the 21st.

PRECIPITATION.

cipitation for the State, based on reports from 78 stations, .63 inches, which is 0.88 inch less than normal. In the western counties and along the Ohio River, it ranged be- 1.60 and 2.50 inches. In general there was an increase ard to 4.5 inches in the southeastern mountain region. pitation was remarkably frequent, occurring in measurable at in the central and eastern counties on nearly every day month. Daily amounts, however, were light to moderate. rincipal periods with more or less general precipitation 1st-7th, 10-14th, and 17-26th. The extremes were 4.67 at Hazard and 0.80 inch at Grant, Boone County. The nowfall ranged between a trace in the southern and 12 in the northeastern counties. An east-west belt across the north-central part of the State received from 5.0 to 8 inches, but the amount decreased sharply to only 1.0 inch in the extreme northern counties.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. †† Received too late to be included in means and summaries.

¶ Postoffice addresses.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

T Precipitation is less than 0.01 inch.

§ Lone Oak.

MISCELLANEOUS.

Flood.—The flood late in January preceding culminated in the lower Ohio on Feb [illegible] crest 1.0 to 1.5 feet above flood stage from Paducah to Cairo. Losses [illegible] ...ond [illegible] ...ver. The Evansville district, and along the Barren and Green rivers, mostly [illegible] ...ber of buildings and suspension of business are estimated at $75,000 to [illegible] ...ers continued at moderately high stages during the remainder of the month.

Precipitation data on summary page for Harlan, should be for Greenup. No data for Harlan.

Errata for January, 1927.

Daily Precipitation for February, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., MARCH, 1927. No. 3

GENERAL SUMMARY.

The month began cold, with snow and several hard freezes that had a decidedly beneficial effect in holding back fruit buds. After the first few days temperatures continued remarkably equable, with a notable absence of the changeable weather and severe freezes that usually occur periodically in this month. The short cold period at the beginning was followed by two weeks of mild weather in which growth was resumed and vegetation soon took on the appearance generally observed three weeks to a month later. Peaches, plums and pears began to blossom about the middle of the month, and were in full bloom with fruit setting by the end of the warm spell. Many shrubs and some trees put out the first leaves. Cool weather, with heavy frosts, in the last decade apparently caused little damage but had a checking effect on growth. During the first three weeks frequent, often heavy, rains seriously interfered with outdoor work and almost entirely prevented plowing. Sowing of tobacco plantbeds proceeded with difficulty, being possible only occasionally. Standing water caused wheat on flat land to turn yellow. Roads remained in bad condition, and there was considerable flooding of bottom lands in the western part of the State. In the last decade fair weather and normal sunshine were more favorable. For several days the soil continued wet and unworkable, but toward the end of this period the sowing of plantbeds was finished, some potatoes and early gardens were planted, and a beginning was made with spring plowing. After the first week, wheat, rye, and bluegrass grew steadily and appeared exceptionally advanced by the end of the month. Wheat stooled well and exhibited no injury of consequence from winter killing. On warm slopes pastures were ready for grazing. The month closed with most vegetation far ahead of the season, farm activites much behind, and the soil again saturated by heavy rains.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 48.4°, which is 2.6° above normal. The four-day period of low temperatures at the beginning of the month was followed by abnormally warm weather that continued until the 20th, after which temperatures near or below normal prevailed. After the first few cold days minimum temperatures seldom fell below freezing except at the extreme northern stations. Extremes for the month were 82° at Williamsburg on the 20th and 10° at Beaver Dam, Hindman, and Williamsburg on the 3d.

PRECIPITATION.

Precipitation for the State, based on reports from 80 stations, averaged 6.04 inches, which is 1.20 inches above normal. In the western half of the State, monthly amounts ranged between 5.00 and 12.00 inches; while in the eastern half they varied between 3.00 and 6.00 inches, diminishing toward the northeastern and southeastern boundaries. Rain occurred generally in the periods 6-8th; 12-14th; 17th-21st, and 31st. The amounts were excessive locally, especially in the central and western counties, on the 12th, 13th, 18th, 20th, 21st, and 31st. Snow ranging in amount from 1.0 to 8.0 inches occurred in the central and southern counties on the 1st and 2d. The extremes were 2.36 inches at Hazard and 12.71 inches at Murray.

MISCELLANEOUS.

March 31.—Windstorms caused damage to buildings in Hopkins, Christian, McLean, Grayson, Daviess, and Barren Counties estimated at $60,000.

[illegible] ranges and or [illegible]

A dash in temperature data are taken from self-registering Fahrenheit instruments. Precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. The departures from normal temperature and precipitation are computed for the Eastern, Central and Western Divisions and in the Ohio River Valley, using for each station in determining section or division means. ‡Ramsey, Brownsville and Woodburn are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.

*Also on other dates. **Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶Post-office address.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

[illegible]. The Ohio River remained at moderate to high stages during the month. It [illegible] at Cairo just slightly under flood stage on the 1st, and was above flood stage at [illegible] stations from the 23d to 25th. It was above flood stage at Paducah from the 21st to [illegible] at Cairo and in the Mississippi from the 17th to the end of the month, and at Evansville after the 21st. High stages occurred in the Green from the 20th to 25th. There was considerable flooding of lowlands along the Green and lower Ohio.

Errata for February, 1927.

Shelbyville, minimum temperature for month, 15° on 11th, instead of 19° on 21st.

Daily Precipitation for March, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., APRIL, 1927. No. 4

GENERAL SUMMARY.

Temperatures above normal predominated during the first two decades, causing rapid growth and abnormal advancement of all vegetation, The freezing temperatures and killing frosts that followed this prolonged spell of warm weather, in the period 22d-25th, resulted in almost complete destruction of tree fruits in the northern and eastern counties, and extensive damage in other districts. Strawberries, at that time in full bloom, were injured to the extent of about half of the crop. Wheat had reached the jointing stage, and probably suffered some injury. It was believed by experts that seed bluegrass was considerably damaged. Precipitation was frequent and often heavy, especially in the western counties. Except on a few days near the end of the month, plowing was generally impossible on account of the saturated condition of the soil. As a result very little land was made ready for corn, tobacco or cotton, potato planting and oats sowing could not be pushed, and gardening remained almost at a standstill. The oats sown and potatoes planted represented only a small part of these crops, which will be greatly reduced in acreage. Except in gardens, practically no corn was planted. Wheat and rye grew rank, and suffered in places from excessive moisture. On level lands and close soils wheat turned yellow, and in all districts it showed in its color the effect of lack of sunshine. Clover and alfalfa also reached an advanced stage and were somewhat injured by the freezed. Tobacco plants made seasonable progress and, being protected by cloth, escaped damage. In the western counties large areas of lowland was under water, while level or nearly level uplands were more or less affected by standing water during most of the month. In such districts practically no agricultural progress occurred. The month, ended with heavy rains, saturated soils, and all farm work in a discouraging state of delay.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 58.7°, which is 2.8° above normal. In the brief cold period from the 21st to 25th, temperatures averaged from 10° to 20° below normal in most districts. In the two periods of high temperature, 17-20th and 27-28th, maxima between 80° and 90° occurred at most stations. The extremes at the various stations were 92° on the 27th at Williamsburg and 22° on the 26th at Farmers.

PRECIPITATION.

Precipitation for the State, based on reports from 80 stations, averaged 6.39 inches, which is 2.36 inches above normal. In the western counties, including the lower Green River Valley, monthly amounts ranged between 7.0 and 10.0 inches. Most of the eastern third of the State received 5.0 to 7.0 inches. An irregular north-south belt through the central districts received from 4.0 to 5.0 inches. Rain occurred daily from the 1st to the 22d inclusive. Amounts in this long period were light to moderate on most days, except in the western counties, where they were heavy locally on the 5th and almost daily from the 8th to 14th. Moderate to heavy rain also occurred in the period 29-30th. The extremes for the month were 3.89 inches at Lexington and 13.25 inches at Paducah. Hail occurred on the 29th at Louisville, Williamstown, and Murray, but caused no damage of consequence.

All temperature data are taken from self-registering thermometers.
The departures from normal temperatures and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
The departures from normal temperatures and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River
Reference letters, *, b, *, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.
* Also on other dates. ** Received too late to be included in means and summaries T Precipitation is less than 0.01 inch rain or melted snow

MISCELLANEOUS,

April 1.—Wind-storms in western Kentucky caused damage to buildings, wire systems, etc., estimated at $50,000 in McLean County, and $40,000 in Grayson, Barren, Carrollton, and Hopkins counties.

April 21.—Winds removed 43 houses from their foundations in the flooded district of Ballard County.

April 29.—Windstorms in Anderson and Bourbon counties, caused damage to buildings estimated at $30,000; and a loss of about $20,000 in or near Louisville.

Daily Precipitation for April, 1927.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the ime of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

§ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking: (K) Kentucky: (S) Salt: (G) Green: (C)Cumberland T) Tennessee: (O) Ohio: (M) Mississippi. ¶Lone Oak.

Rivers:—The Ohio River continued at moderately high stage, with a large volume of water throughout the month. It was near or somewhat above flood stage at Paducah, considerably above flood stage at Cairo, during the entire month. It was above flood stage at Evansville from the 14th to 18th. Columbus, Ky. was flooded on the 14th due to the breaking of a levee. Hickman was partly flooded during the latter half of the month.

Daily Temperatures for April, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., MAY, 1927. NO. 5

GENERAL SUMMARY.

This was one of the most unfavorable months of the name ever known in the climatic history of the State. Rains almost daily, frequently heavy to excessive, kept the soil generally saturated and rendered plowing practically impossible in large areas. Because of the delay due to the two unfavorable months preceding, farmers used their utmost efforts to plow and plant in the brief intervals of fair weather. Even the best drained uplands were worked much too wet. The limited progress made was almost entirely confined to the best drainage and the lighter soils. Partly because of topography and character of soil and partly on account of somewhat lighter rainfall, progress was better in some eastern and south-central sections than in other districts. On a large percentage of farms in the western and north-central counties no corn was planted, and breaking of ground was barely commenced. In some more favored localities east and south, probably half of the crop was planted. At the end of the month the situation with respect to the corn crop was the worst in many years. The cloudiness, repeated drenchings, and spells of low temperature retarded tobacco plants, which reached the size for setting a week to ten days late. Considerable transplanting occurred in the last week, mainly in the eastern and southern counties, where about half of the land to be devoted to this crop had been prepared. The small crops of oats and potatoes made fair progress where they enjoyed good drainage. Wheat also varied in growth and condition with soil and drainage, but it did not make satisfactory progress anywhere. The lower foliage turned yellow, pollenization was affected by rains, and considerable rust appeared in places. In some soils it grew rank, while in super-saturated areas it appeared stunted. Heads were frequently undersized, and there was evidence of injury from the freezes in the preceding month. Alfalfa and clover reached the cutting stage but could not be cured. Pastures became so soft at times as to be injured by the grazing stock. Gardens could not be cultivated or entirely planted, hence the supply of vegetables was unusually short. Rains interfered seriously with picking and marketing of strawberries. Seed bluegrass suffered from lack of sunshine and dry weather while maturing.

TEMPERATURE.

The temperature for the State, 43 stations reporting, averaged 55.7°, which is near normal. Temperatures above normal prevailed in the first decade and in the week following the 18th; but they were much below normal in the periods 11-17th and 26-28th. Maxima were somewhat lower than usual for this month. The extremes were 93° at Bowling Green and Williamsburg on the 21st and 31° at Farmers and Middlesboro on the 17th

PRECIPITATION.

Precipitation for the State, as determined from reports of 82 stations averaged 7.44 inches, which is 3.47 inches above normal and the highest on record for May. In limited areas in the southwestern counties, the northern bluegrass, the southeastern district, and the Big Sandy Valley, amounts ranged between 5.5 and 6.0 inches. Most other districts received from 7.0 to 10 inches, while in the western part of the Purchase, some north-central districts, and in Perry county, from 10 to 12 inches occurred. Rain was reported from some part of the State on every day in the month. It was moderate generally and heavy locally on the periods 4-10th, 13-14th, 18-19th, 24-26th and 28th-31st. Excessive rains in the southeastern mountains on the 26th-31st caused disastrous floods in the Kentucky and other Eastern Kentucky streams. Thunder-storms were prevalent on 15 days and hail in many localities on four days. The extremes for the State were 3.34 inches at Greenup and 12.56 inches at Brandville.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
§Lone Oak
†Precipitation is less than 0.01 inch rain or melted snow
Also on other dates. †† Received too late to be included in means and summaries
¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

May 5. Several barns and considerable timber were destroyed by windstorms in Christian County.

May 27. A hail and windstorm caused damage estimated at $100,000 in Grayson County. Most of the damage was caused by wind in the destruction of barns and timber. Hail lay from two to eight inches deep in Leitchfield 12 hours after the storm.

May 29. Hail and wind caused one death and damage estimated at $50,000 in Pulaski County. About half of the damage was due to destruction of crops by the hail, which also killed chickens and hogs.

May 31. Headwater floods, caused by excessive rains on the night of the 30th

Daily Precipitation for May, 1927.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

used enormous damage in about 14 of the southeastern mountain counties. The latest losses occurred along the upper Kentucky River and its tributaries in Letcher, ry and Breathitt counties. The drowned and missing were estimated at 89 persons; homeless at ten to fifteen thousand; idle because of the washout 20,000, and total ss at seven to ten millions of dollars. In Perry County about 500 homes were shed away, and in Floyd about 100. Losses at Hazard alone, which was in the area of greatest rainfall, were placed above $1,000,000. The losses of the L. & N. Railroad in the devastated area were estimated at $1,500,000.

Rivers.—In the upper and middle sections the Ohio River remained moderately high, while in its lower course it was only a few feet below flood stage during the month. It was above flood stage at Cairo until the 5th. The Kentucky River reached a crest of 37.6 feet at Hazard and 34.8 feet at Beattyville on the 31st. Except in the flooding of lowlands, there was no damage of consequence below Beattyville

Daily Temperatures for May, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., JUNE, 1927. No. 6

GENERAL SUMMARY.

The weather during the first three weeks was cool, cloudy, showery and generally unfavorable. In the intervals of sunshine, usually two to three days in length, plowing and corn planting were pushed with soil too wet and progress in the northern counties confined to the best drained uplands. By the middle of the month planting was practically finished in the southern and eastern counties, where the character of soil and favorable drainage had permitted better progress. It remained far behind in the northern districts, where farmers continued to plant until the end of the month but failed to get out the normal acreage. In these districts most of the crop was planted during the last two weeks, which was the first period in which lowlands and the close soils of that section could be worked. Many farmers resorted to the use of quick maturing varieties in order to overcome the handicap of the extremely late planting. Tobacco setting proceeded as the land could be prepared, and was finished later than usual. The delay was greatest in the northern counties, where transplanting could not be completed until late in the month. The moderate temperatures and showers resulted in a good stand. Early corn and tobacco became very weedy because cultivation had to be neglected in order to finish planting corn, make clover and alfalfa hay, and harvest barley and wheat. In this respect conditions were somewhat better in the southern counties, where planting had not been so seriously delayed. Wheat developed irregularly, its progress and condition depending largely on drainage and character of soil. Heads did not completely fill and rust caused much injury. Harvest commenced near the middle of the month, almost coincident with the advent of better weather. A few hot days near the end of the month cured the shocks, and threshing began at once. Yields were generally disappointing. Stripping of blue grass seed proceeded in fairly good order in the intervals of sunshine. Heads were lighter than usual. Alfalfa and clover deteriorated in the field and became woody before harvest was possible. Gardens and truck improved, but continued rather poor with fields of vegetables exceptionally light. Favorable conditions in the cotton district during the last two weeks caused steady improvement in that crop.

TEMPERATURE.

The temperature for the State, 43 stations reporting, averaged 70.4°, which is 3.5° below normal. Only five Junes in the last 38 years have been cooler than this. Except in two short periods of two days each, daily temperatures averaged below normal, due largely to cloudiness and rain that lowered the maxima. The extremes were 98° on the 30th at Hopkinsville, Murray, and St. John, and 42° on the 16th at Bowling Green.

PRECIPITATION.

Precipitation for the State, as determined from reports of 80 stations, averaged 4.13 inches, which is nearly normal. In the southwestern counties, and in areas limited to a few counties in the north-central, northeastern, and southeastern parts of the state, amounts ranged between 5.0 and 7.0 inches. Other districts received from 2.0 to 4.0 inches. The extremes for the state were 2.01 inches at Munfordville and 7.53 inches at Frankfort. Except on four or five days, showers occurred daily from the 1st to 26th, inclusive. They were moderate in most districts and heavy locally in the periods 3d-4th, 14-15th, 17-19th, 21st-22d, and 26th. Thunderstorms were frequent and often severe, but not usually destructive.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section, or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
‡ Also on other dates. †† Received too late to be included in means and summaries.
¶ Post-office addresses: — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.
T. Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

MISCELLANEOUS.

June 2. — A windstorm wrecked the steel work of a six story building at Paducah, with a loss estimated at $50,000. The wind uprooted numerous barns and other buildings in McCracken County. Hail attending this storm caused considerable damage.

Rivers. — From stages much above normal for this time in the season, the Ohio River declined to the usual summer condition along all except the extreme lower course. From Cairo to Paducah it was still moderately high but falling when the month closed.

Daily Precipitation for June, 1927.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. ▼ Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (O) Ohio; (M) Mississippi; (T) Tennessee: (O) Ohio: (M) Mississippi. (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland

¶ Long Oak.

Errata for May, 1927.

Bowling Green, monthly mean temperature should be 67.9°. Greensburg, total precipitation should be 8.48. Mayfield, total precipitation should be 9.35. Leitchfield, days partly cloudy 20; cloudy 6. Maysville, days partly cloudy 7; cloudy 13. Shelbyville, cloudy days 15.

Daily Temperatures for June, 1927.

JAMES L. KENDALL, Meteorologist.

Vol. XXXII LOUISVILLE, KY., JULY, 1927. No. 7

GENERAL SUMMARY.

Moderate temperatures and generous sunshine favored crop development, the completion of harvest and threshing, and other seasonal activities. Deficient precipitation until late in the month, following the long period of super-saturation, allowed the soil to harden and prevented satisfactory cultivaton. Showers near the middle of the month relieved this condition in some districts, but it was only near the end that rains in sufficient amount to soften the soil occurred generally over the State. The corn crop, variable and most of it extremely late, made fairly good progress during the first two weeks, after which its growth was retarded by dry weather. Early corn and tobacco on hills and upland were suffering for rain when it came in the period 28-30th. Corn that had reached the tasseling stage showed a tendency to "fire". Late corn and tobacco developed large root systems during the dry weather, hence the rains were followed by marked improvement. Early corn was insufficiently cultivated and often weedy when laid by. Although difficult because of dry soil, the cultivation of the late crops was fairly good. Not much tobacco reached the topping stage. In most districts threshing was finished, with grain in excellent condition but yields continuing unsatisfactory. Second crop alfalfa was cut very late because of the late removal of the first crop. On many farms the second crop was still growing at the close. Early potatoes matured a crop of good quality but short acreage. Dry weather and hard soil interfered with planting late potatoes. Field tomatoes, which had been transplanted late, grew slowly, but improved quickly after the rains. The large acreage of cowpeas and soybeans made good progress. Mowing of forage crops continued until the middle of the month. Pastures dried rather badly in places, particularly on the warm slopes and dry uplands, but remained fairly good on other fields. Cotton was small, but generally well cultivated. It reached the blooming stage in the last week.

TEMPERATURE.

The temperature for the State, based on reports from 44 stations, was 75.7°, which is 1.2° below normal. As compared with the seasonal average, temperatures were somewhat lower in the western than in the eastern counties. Maxima were generally moderate, periods of high temperature being limited to one to three days. Extremes for the State were 101° on the 7th at Bowling Green and 45° on the 6th at Farmers.

PRECIPITATION.

Precipitation for the State, 81 stations reporting, averaged 4.71 inches, which is 0.46 inch less than normal. It was heaviest near the Ohio River and in the eastern mountain district, where amounts in limited areas ranged between 4.0 and 6.0 inches. In the southern counties and most of the bluegrass region beiween 2.5 and 3.5 inches occurred. Precipitation was light and scattered in the western counties during the first decade, but there were moderate to heavy local showers on a few days in the central and eastern divisions. Moderate to heavy rains occurred rather generally in the periods 13-18th and 30th-31st, although the distribution continued irregular. Local showers also occurred from the 21st to 23d. The extremes for the State were 1.81 inches at Williamstown and 6.72 inches at Maysville. Thunderstorms were not especially frequent and No hail of consequence was reported.

MISCELLANEOUS.

July 10.--A windstorm caused considerable damage to wire systems in Shelby and Franklin counties.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

§Lone Oak.

* Also on other dates.

† Precipitation is less than 0.01 inch rain or melted snow.

** Received too late to be included in means and summaries.

¶ Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

July 27.—Two boys at work in the field near Winchester with a team of mules were struck by lightning. One boy and the mules were killed and the other boy was severely burned.

Errata for June, 1927.—Farmers, greatest rainfall in 24 hours should be 1.29, on 2d. Hindman, monthly mean temperature should be 70.0. Greensboro, clear days 17, cloudy 10. Paducah (near), monthly mean temperature should be 73.8; departure from normal temperatures −3.2.

Rivers.—The lower Ohio River continued to fall until the usual summer stages were reached. Pool stages prevailed generally in the upper Ohio and the other streams of the State.

Daily Precipitation for July, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., AUGUST, 1927. No. 8

GENERAL SUMMARY.

The month was one of the coolest of the name on record. he effect of the low temperature was especially serious because the lateness of the staple crops, a large proportion of which nged from two weeks to a month behind the usual stage of velopment. Normal temperatures in the second week vored growth, otherwise low maxima, cold nights, and cloudi- ss were persistently detrimental. Late corn that could arcely be expected to ripen under seasonable conditions, was rther retarded and its maturity rendered unlikely. Under mperature conditions so adverse for corn, the prevailing dry ather was rather favorable than otherwise. Early corn was w in earing, while late corn grew and tasseled unevenly, the aracter of soil playing an exceptionally important part in the e of growth. Late corn on cold, close soils made exceedingly w progress, while the crop on the warm limestone soils of e eastern and south-central counties made fairly good progress spite the cool weather. Although tobacco was also retarded the low temperature, it is probable that lack of moisture s most potent in delaying this crop. Early tobacco developed evenly, making complete topping difficult. The irregularity growth was even more marked in late tobacco. Its slow wth and small size led farmers to put off topping, which had been completed at the end of the month. Early tobacco ened very slowly, and there was but little cutting. Except warm, dry slopes, pastures continued generally good, the ual late summer tendency to dry up being checked by the normal weather. Late white and sweet potatoes made a good rt, but needed additional moisture. Field tomatoes showed effect of the weather in slow fruiting and ripening. Gardens d truck yielded less than usual, although the plants remained althy. In the cotton district there was more sunshine, also d showers occurred in the third week; hence the crop made newhat better progress than would be expected under such mperature conditions. At the end of the month there was at need of rain and a relatively long period of high temp- ture to bring the late crops to anything like satisfactory turity.

TEMPERATURE.

The temperature for the State, based on reports from 44 sta- ns, averaged 71.1°, which is 4.5° below normal; and with exception of August, 1889, the lowest of record. It was y slightly lower, however, than the average for August, 5. Normal temperatures were registered on a few days in first half of the month, but in the last two weeks daily ans ranged generally from 2° to 13° below normal. In this iod minima below 50° were recorded on several days at ny stations. The extremes were 97° at Hopkinsville on the h and 43° at Murray on the 26th.

PRECIPITATION.

Precipitation for the State, 80 stations reporting, averaged 8 inches, which is 0.83 inch less than normal. It was very gularly distributed, but in general it increased from about inch in the western counties to about 5.0 inches in the east- . In the western and central districts it ranged from 1.0 .0 inches, while in the northeastern, eastern, and southeast- counties from 4.0 to 5.0 inches occurred. Light to heavy wers occurred in the periods 1st-4th, 8-9th, and 17-25th. The rains of the 14-15th were fairly general in all except the Purchase. The extremes for the State were 0.74 inch at Greenville and 6.04 inches at Flemingsburg. Few thunder- storms occurred, and these were rarely attended by damage.

State averages and extremes				71.1	−4.5	97	13	43	26	43	2.88	−0.83	2.50	0	8	16	8	7	s.	

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are

used in determining section or division means. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky Rive

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oa

* Also on other dates. ** Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. ¶Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Aug 13.—A hail and wind-storm caused some local damage in northwestern McClean County.

Aug. 19.—Lightning burned a barn near Lexington and started a fire in the city.

Rivers.—All rivers of the State, including the Ohio, declined to low stages dur the month.

Errata for July, 1927.—Paducah, near, days clear should be 26, cloud St. John, highest temperature 94 on 2nd.

Daily Precipitation for August, 1927.

VOL. XXXII LOUISVILLE, KY., SEPTEMBER, 1927. No. 9

LIBRARY OF THE OCT 17 1927 UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

Except for about five unseasonably cool days in the third decade, temperatures averaged above normal and were decidedly favorable for the development of the backward crops. The long period of high temperature from the 1st to 18th, in which the warmest weather of the summer occurred, was of the greatest value to corn. This crop, seriously delayed in planting, had failed to make seasonal progress on account of the abnormally low temperature of the preceding month. The continuous high temperatures and warm nights had a marked forcing effect, hastening perceptibly the time necessary to mature early corn and greatly enhancing the probabilities of making something of the late crop. The dry weather was also a factor in hastening maturity. Some corn "fired" on uplands and hills, but most of the crop did not suffer to any great extent. In the main the dry weather benefited the crop much more than it injured it. Early tobacco ripened rapidly, and cutting and housing proceeded under highly favorable conditions. The heat and drought adversely affected late tobacco, retarding its growth and causing premature and imperfect ripening. Cutting advanced as "priming" at the bottom offset its possibilities of growth at the top. Rain near the close of the month started the remainder of it to drying, with consequent delay to ripening and cutting. Frost in spots on the 21st, mostly on lowlands, caused considerable damage to tender vegetables and slight injury to late corn and cane in a belt of counties extending across the central portion of the State from northeast to southwest. It was heaviest in the upper Green River Valley, where temperatures fell below freezing and ice formed in places. Light frost was also reported locally on the 22d and 23d. What injury occurred was limited in area and of little importance to the staple crops. Except for the frost damage, late hay from peas, soys and alfalfa was cured in unusually fine condition. Late potatoes suffered from drought, and pastures dried rather seriously toward the end of the month. Field tomatoes ripened well, but were damaged by blistering on the hottest days. Cotton made excellent progress. On the whole September weather did much to overcome the handicap imposed on agriculture by the wet spring and the low temperature of the preceding month.

TEMPERATURE.

The temperature for the State, based on reports from 41 stations, averaged 72.2°, which is 1.9° above normal and 1.1° higher than the preceding month. The period 11-18th was very warm, with daily means 10° to 15° above normal and maxima 100° or higher at several stations in the western and southern counties. In marked contrast were the low temperatures of the 20th-23d, with means as much below normal and minima of 32° or lower at some stations. Extremes for the month were 103° at Hopkinsville on the 15th and Greensburg on the 16th; and 30° at Greensburg on the 21st, 22d, and 23d.

PRECIPITATION.

Precipitation for the State, 80 stations reporting, averaged 3.87 inches, which is nearly normal. The distribution was quite irregular, but in general amounts decreased from about 8.0 inches in the western to 1.0 inch in the northeastern counties. The central and eastern counties received from 1.5 to 3.0 inches. There were considerable areas in the south-central part of the State, the Licking Valley, and along the eastern border where only 1.0 to 2.0 inches occurred. Local showers, usually light to moderate but occasionally heavy, occurred in the periods 2d-11th and 18-19th. Heaviness in the southern counties was due to heavy rains on the last three days that dominated records of the month. The extremes for the State were 0.27 inch at Greensburg and 8.08 inches at Barbourville. Thunderstorms were not especially frequent, and no damaging hail was reported.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. †Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

* Also on other dates. †† Received too late to be included in means and summaries. ¶Post-office addresses: – Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

[illegible] Stages remained low during the month

Errata for August, 1927.—Lexington: Maximum on 9th should be 75; mea maximum should be 77.6; monthly mean temperature should be 69.5, departure fro normal −5.0.

Daily Precipitation for September, 1927.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., OCTOBER, 1927. No. 10

GENERAL SUMMARY.

Except for about a week of cool weather near the middle of the month, in which there were several light to heavy frosts, temperatures averaged generally above normal and were decidedly favorable for maturing and ripening the late crops. The abundant sunshine, and the rainless period that followed the 12th, were also timely and highly beneficial. Much late corn that under ordinary weather conditions could not have been expected to mature, made remarkable progress and ripened a fair crop. In the long period of fine weather the ripening corn dried very rapidly, with much improvement in quality. The corn last planted, which had seemed hopelessly late, responded so well to the temperatures of the last decade that most of it reached maturity. Early shocked corn dried out thoroughly, and there was considerable gathering in the last week. After the 12th harvesting and curing of late hay, plowing and seeding, cutting and housing of late tobacco, and other fall work, proceeded under exceptionally favorable conditions. Two periods of heavy rain early in the month delayed plowing and seeding to some extent, although they supplied needed moisture in the western counties. High winds, accompanying these rains blew down corn rather generally, which necessitated cutting before grain could be sown. Corn cutting advanced rapidly, even the cutting of late corn being almost completed. Wheat sowing was finished near the end of the month. At that time most wheat had come up, with the stand excellent and the growth rapid. Early wheat has seldom presented a better appearance at the close of this month. Late potatoes, both white and sweet, improved where they had not been too severely frosted. Light to heavy frosts occurred quite generally in the third week. They were probably killing in some eastern districts, but in most of the State they caused little damage to the staple crops. The rains revived pastures and caused a good cover growth of clover and alfalfa. Late tobacco cured out more quickly and with better color than usual so late in the fall. Cotton bolls opened so freely toward the end of the month that fields appeared white. The light frosts were helpful in checking the growth of foliage.

TEMPERATURE.

The temperature for the State, based on reports from 45 stations averaged 60.7°, which is 2.6° above normal. Three days of high temperature at the beginning were followed by two weeks of moderately cool weather, which culminated in frosts on the 17th and 18th. In the last decade mean temperatures ranged from 5° to 20° above normal. The extremes for the State were 92° from the 1st to 3d at several stations, and 27 on the 17th at Farmers.

PRECIPITATION.

Precipitation for the State, 81 stations reporting, averaged 2.61 inches, which is practically normal for this month. Its distribution was quite irregular. In general it was heaviest in the western and northwestern counties, where it ranged from 4.0 to 5.0 inches. It decreased toward the southeast, ranging from 1.0 to 2.0 inches in most of the section extending from the south-central counties northeastward to the upper Ohio and Big Sandy rivers. Moderate to heavy rains occurred in the western counties on the 3d. Except in the southeastern section, they were general over the State in the periods 7-8th and 12-13th. The extremes for the State were 0.95 inch at Williamsburg and 5.79 inches at Hopkinsville. Thunder storms occurred on only a few days, but they were accompanied rather generally by winds that blew down corn.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at time of observation.

(Cooperative mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation [illegible] hours.

† Separate interval falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy, (L) Licking, (K) [illegible] Green, (T) Tennessee, (O) Ohio, (M) Mississippi.

¶ In the Oak

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

OL. XXXII LOUISVILLE, KY., NOVEMBER, 1927. No. 11

GENERAL SUMMARY.

Daily mean temperatures varied from 15° above normal to much below during the first three weeks; but minima were t especially low. Light freezes in the periods 5-8th and 17-th temporarily checked the growth of fall grains, but the markably high temperatures of the last decade, with minima ove freezing and maxima frequently above 70°, caused un-asonable advancement of much vegetation. Marked improve-en: occurred at this time in late sown wheat, which was quite all and not sufficiently rooted; and pastures continued in usually fine condition for the time of year. With these ex-ptions, the effect of the mild weather on vegetation was un-vorable. Some apprehension was felt in regard to the possible nting of the earliest wheat and rye. In some instances buds trees swelled as in late spring, and occasional blossoming of uit trees and strawberries was reported. In the western unties some alfalfa became almost large enough to cut, and ver exhibited luxuriant growth. There was complaint of e presence of Hessian fly in some unduly advanced wheat, general this crop has seldom presented a more thrifty appear-ce at the end of this month. Precipitation averaged consid-ably above normal and in large areas was excessive. The quency of showers led to some loss of time in corn gathering, account of the lateness of the corn crop, gathering was rted somewhat later than usual. Progress was fairly good, work being facilitated by the mild temperature and absence the usual blustery fall winds. The soil remained wet, due part to the excessive cloudiness; hence down corn, which med a rather large percentage of the crop in some districts, ntinued to deteriorate. Shocked corn remained in good con-ion. Dampness sufficient to soften tobacco for stripping, curred in two or three periods, and this work commenced in imited way. Stock fared well and less feeding than usual s required.

TEMPERATURE.

The temperature for the State, based on reports from 44 sta-ns, averaged 51.3°, which is 5.0° above normal. Minimum nperatures below freezing occurred less frequently than ual in this month. Maximum temperatures of 60° were orted on about 20 days, while in the western and southern unties they ranged between 70° and 80° on about 15 days. xtremes for the State were 82° on the 1st at several western tions and 13° on the 7th at Farmers.

PRECIPITATION.

Precipitation for the State, 82 stations reporting, averaged 01 inches, which is 1.48 inches more than normal. In the uth-central and extreme northern counties monthly amounts nged between 6.0 and 8.0 inches. In most other sections m 4.0 to 5.0 inches occurred, but there were limited areas the extreme southwest and in north-central districts near e Ohio River where amounts ranged between 3.0 and 4.0 hes. Light to moderate local showers occurred from the to 3d, and moderate to heavy rains in the periods 7-9th d 15-17th. Twenty-four hour rainfalls of 2.00 to 4.00 inches urred at many central and eastern stations on the 16-17th. ere were also light scattered showers in the last week. Pre-itation extremes were 7.95 inches at Greensburg, and 2.68 hes at Lockport on the lower Kentucky River. A few northern stations recorded total snowfalls of 1.0 to 2.5 inches. Thunderstorms were reported on the 2d, 4th, 7th, 11th, 15th and 30th.

All temperature data are taken from self-registering thermometers.

Use of data for frost and temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in the table. Dashes indicate missing data. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and the dates mentioned in connection therewith are division means.

Preliminary values. *, †, ‡, appearing in the table indicate number of days missing; for example, h represents two days, etc. ‖ Trace of precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

* Also on other dates. ° Record or non-homogeneous data not included in means and summaries. ¶ Precipitation not received.

¶Pond, Lock 10, Clark Co., Ky.; Lock 11, Madison Co., Ky.; Lock 12, Estill Co., Ky.; Lock 13, Nicholasville, Ky.; Lock 14, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

[illegible] A windstorm at Lexington caused damage to roofs, windows, and wire [illegible] Sept. 20th at $25,000.

[illegible] 17.57in. caused a freshet in the upper Kentucky, and also a [illegible] reached at moderate stages until the end of the month.

Errata for October, 1927.

Woodbury, days precipitation .01 or more 6. Sergent, days clear 14, partly cloudy 2, cloudy 15. Smithville, days with precipitation 6. Lexington, minimum temperature on 29th 37°, maximum temperature on 8th 80; mean temperature for month 61.

Daily Precipitation for November, 1927.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‖ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Long Oak.

Daily Temperatures for November, 1927.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., DECEMBER, 1927. No. 12

GENERAL SUMMARY.

Although the temperature for the month averaged near normal, the periodical variations departed widely from seasonal conditions. Temperatures far above normal occurred in the periods 11-15th and 28th-30th, with the weather springlike in character, winter clothing uncomfortable, and heat in houses often unnecessary. In striking contrast to this unseasonable mildness were the sudden descents of temperature to points near zero in the alternating cold waves of the 8-9th, 18-19th, and 31st. The first cold spell effectually checked the untimely growth of vegetation, and probably caused some injury. The recurring cold waves prevented further growth, hence the warm weather had no ill effect in this respect. It was highly favorable for handling tobacco and gathering corn, while moderate feeding sufficed to keep stock in good condition. Wheat suffered considerable discoloration from the severe freezes, which also caused some heaving of the soil where drainage was insufficient; but in general no marked injury to winter grains was apparent. In the second week frequent moderate to heavy rains kept the soil saturated and caused sufficient run-off to affect streams, but at other times soil drainage was somewhat better than usual in this month. Several days of fair weather early in the month caused corn to dry much better. About two weeks of fine weather later in the month, with nearly the full amount of sunshine and mean temperatures near freezing, greatly benefited corn in crib and contributed largely to the completion of gathering. The deep freezes and complete thaws quickly softened roads and led to serious injury. These thaws also rendered fields very muddy and interfered with the removal of corn and fodder. Except for a few showery days, the weather in the latter half was ideal for packing of meat on farms.

TEMPERATURE.

The average temperature for the State, as determined from the reports of 43 stations, was 37.4°, which is nearly normal. The remarkable variability is shown in the occurrence of maxima between 70° and 80° in the warm periods and of minima between 0° and 10° in the cold waves. The extremes were 77° at Williamsburg on the 13th, and 1° at Mt. Sterling on the 9th and at Farmers on the 10th.

PRECIPITATION.

The precipitation for the State, 80 stations reporting, averaged 3.37 inches, which is 0.71 less than normal. In the extreme southeastern counties it ranged between 4.0 and 7.0 inches, in other limited areas in the bluegrass region, the mountain district, and the lower Licking Valley, from 4.0 to 5.0 inches occurred. In other districts amounts were mainly between 2.0 and 3.5 inches. They diminished toward the western border to less than 2.0 inches in the southern counties of the Purchase. Snowfall varied between flurries in the western section and 3.0 inches in the southeastern counties. Light to moderate showers occurred in central and eastern districts on the 3-5th, and generally over the State on the 7-8th and the last three days. General rains were moderate to heavy in the period 11-16th. The monthly extremes were 1.35 inches at Mayfield and 6.70 inches at Middlesboro. Thunderstorms were reported from a few localities on the 12th.

MISCELLANEOUS.

Rivers:—A sharp rise in the Ohio from the 14th to 21st crested slightly above flood stage at a few stations on the northeast border and in the stretch between Cloverport and the mouth of the Wabash. Between Maysville and Louisville crests were from 1.0 to 6.0 feet below flood stage. Moderate stages prevailed in other streams on the State.

All temperature data are taken from self-registering thermometers.

The departures from normal for temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow. ‡Lone Oak.

• Also on other dates. †† Record or tie into to be included in means and summaries. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

¶Four different locations. Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Errata for November, 1927

Greenville [illegible] mean temperature should be 50.7

Daily Precipitation for December, 1927.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. † Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking (K) Kentucky (S) Salt (G) Green (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXII LOUISVILLE, KY., ANNUAL, 1927. No. 13

GENERAL SUMMARY.

The outstanding features of the year's weather were the warm winter after the middle of January, with premature growth of vegetation; the severe freezes in late April, which caused considerable injury to fruits and bluegrass; the heavy precipitation in January, March, April and May, which prevented plowing, caused extensive floods, and delayed most planting until the first of June; the abnormally cool August; and the warm and exceptionally favorable fall. The temperature for the year averaged considerably above normal; but there were marked variations, practically reaching the extremes of past records, in the monthly means. The months, January to May, and September to December, were warmer than normal; while the summer months were relatively cool. February mean temperature equaled the highest ever recorded, while the November mean has been exceeded only twice. On the other hand, only one August of record has departed farther below the seasonal average than this one, which had a mean temperature lower than September following. Except in February, precipitation far above the normal occurred from January to May, inclusive. The quantity of rain in April and May, however, was less decisive in its influence on agriculture than its remarkable frequency. In these two months there were only a few days when the soil was in condition to be worked or when planting could be properly done. This resulted in very late crops and a decided curtailment of acreage of both corn and tobacco. Even in the first half of June, when most of the planting occurred, the soil remained generally too wet. Wheat grew rank and partly failed to fertilize, causing light heads. The failure of fertilization during the rainy weather also affected the setting of fruit. Weather for harvest late in June was fairly satisfactory, and for threshing in July was excellent. The dryness and high percentage of sunshine in July and August were rather favorable for corn, offsetting to a considerable extent the effect of the low temperature. Crops were retarded, however, from lack of moisture. The highly favorable weather of September and October rapidly matured the belated crops and increased expected yields. General killing frosts did not occur until the first week in November. Ideal weather prevailed in the period of fall seeding, with moisture sufficient to insure germination. Vigorous growth continued during the warm November, and grains entered the winter in unusually fine condition. Pastures remained good until early in December. Corn gathering was favored by high temperature but delayed somewhat by frequent rains.

The Weather By Months.

JANUARY.—The first half was decidedly cold; but the last half abnormally warm, with frequent and excessive rains. Floods occurred in most streams of the State during the third week.

FEBRUARY.—The month was remarkably warm and fairly dry, with conditions favorable for outdoor work and for handling tobacco. Peach buds expanded until they showed color and some shrubs began putting out leaves. As a rule the snow melted off soon after it fell.

MARCH.—A short cold period at the beginning was followed by prevailing mild weather, in which vegetation made rapid advancement. Fruit trees were blossoming by the middle of the month. Frequent rains prevented most outdoor work. Tobacco plantbeds could be sown only occasionally. Some plowing was done in the short period of good weather near the end.

APRIL.—Warm weather predominated during the first two decades, with marked growth of vegetation. The frosts of the 22d-25th caused damage to strawberries, then in full bloom, to the extent of about half of the crop. Precipitation was frequent and heavy. Much level land was covered by standing water. Very little plowing was done and practically no corn was planted.

MAY.—The month was extremely unfavorable, with almost daily rains and farm work nearly impossible. Because of topography and somewhat lighter rainfall, some progress in plowing and planting was made in the eastern and southern districts. Precipitation was the highest of record for May. Even the best drained uplands were worked too wet.

JUNE.—The month was cool with normal precipitation. Plowing and planting were pushed with soil generally too wet. In the western counties most of the corn crop was planted in the last two weeks. Tobacco setting was also finished later than usual. Cultivation was difficult and crops remain generally weedy.

JULY.—The month was rather dry with moderate temperature. Early corn and tobacco on hills and uplands were suffering for rain when it came near the end. Shocked wheat cured out well and was threshed in excellent condition. The weather also favored hay harvest. There was marked improvement in cultivation.

All temperature data are taken from self-registering thermometers.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

[f] Also on other dates.

ABSTRACT.—The month was dry and very cool. Crops, especially corn, were retarded to the fine temperature. Late corn presented an exceptionally poor appearance, with little prospect of maturing. Tobacco was also very uneven and backward. Pastures continued good.

SUMMARY.—With fairly temperature and normal precipitation, conditions favored preparation of the backward crops. Some corn lead but in the main the fairly dry weather helped it greatly. Frost on the 21st caused some damage to tender vegetables in the central counties.

OBSERVATIONS.—Prevailing warm weather and normal rainfall favored late crops. In the dry period after the 12th much late corn matured that under ordinary weather conditions would never have ripened. Light to heavy frosts occurred in the third week, but they caused little damage.

Monthly and Annual Precipitation for the Year 1927, with Departures from the Normal.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining the section or division means.

T. Precipitation is less than 0.01 inch rain or melted snow.

†Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

NOVEMBER. The month averaged warm and rank growth of fall grains caused some apprehension. Pastures remained in excellent condition. Precipitation was much above normal and in some areas excessive. It interfered considerably with corn gathering.

DECEMBER. Temperatures varied widely, with decidedly warm spells alternating with sharp cold waves. Rainstorms prevailed and at times heavy. On the 27th and 28th Fine weather in the last half favored outdoor work.

Monthly and Annual Mean Temperatures for the Year 1927, with Departures from the Normal.

All temperature data are taken from self registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or district means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

VOL. XXXIII LOUISVILLE, KY., JANUARY, 1928 NO. 1.

GENERAL SUMMARY.

Temperature conditions were characterized by sharp departures both above and below the seasonal average. The month began with a cold wave in which minima below zero were registered generally throughout the State, and mean daily temperatures ranged from 25 to 40 degrees below normal. This cold spell was followed by a two-weeks period of mild weather in which minima were almost continuously above freezing and maxima ranged from 60° to 75°. In the last week another cold wave of less severity than the first depressed temperatures nearly to zero and brought daily averages from 10° to 25° below normal. These sharp changes, with the deep freezes and complete thaws that resulted, injuriously affected wheat and grasses. The injury was greatest to late sown wheat, which was not sufficiently rooted to withstand much heaving. It was scarcely less damaging, however, to early wheat on clay lands or soils inclined to hold water. Although precipitation was less than normal, it occurred in frequent light to moderate amounts that kept the water content of the top soil so high as to favor the lifting action of the freezes in land that fails to drain quickly. Under these conditions the wheat on the clay uplands of the central counties suffered severely, reports indicating that in some fields nearly one-half of the plants have been pulled up. On sandy soils, and those with good drainage, wheat remained in fairly good condition during the month. Growth began in the long warm period, but was checked by the cold that followed in the third decade. Soft fields impeded the gathering of the remnant of corn. Roads suffered further injury from heavy trucks while soft, but in this case the light precipitation was a favorable factor. More than the usual sunshine contributed to make the month largely pleasant and favorable for outdoor work. The warm weather also favored egg and milk production, but interfered with packing of meat on farms.

TEMPERATURE.

The temperature for the State, based on reports from 44 stations, averaged 35.0°, which is 0.5° below normal. Most of the mild weather occurred in the period, 6-19th, when daily means ranged from 5° to 25° above normal. In the relatively short cold spells, severe temperatures lasted only two or three days. The extremes were 76° at Williamsburg on the 15th and −8° at Junction City on the 2d.

PRECIPITATION.

Precipitation for the State, averaged 2.47 inches, which is 1.91 inches less than normal for this month. It occurred generally over the State in the periods, 8-9th, 17-20th, and 24-25th, and locally from the 28th to 31st. The rainfall was moderate to heavy on the 18-19th, and locally on the 8th and 24th. Snowfall was comparatively light, ranging from flurries in the extreme western counties to 1.5 inches in the northern counties, and 3.0 inches in the central and southeastern district. Nearly all of it occurred in the last four days. In the south-central counties, and in limited areas in the Licking Valley and southeastern mountain section, precipitation ranged between 3.0 and 4.0 inches. In most other districts from 1.5 to 2.5 inches occurred. In general it decreased northwestward toward the Ohio River. The monthly extremes were 0.90 inch at Ravenna and 4.24 inches at Jenkins. Thunderstorms were reported on the 19th and 24th.

MISCELLANEOUS.

January 19.—A tornado with a path about 150 feet wide and 16 miles long occurred in Jefferson County. It appeared near Shively, at 7 29 a. m. passed through the southern extremities of Louisville causing extensive damage, and disappeared near Anchorage about 16 to 20 minutes later. At the same time another tornado, moved parallel to the first one in a similar path about four miles long, extending from Bern Creek to a point

State averages and extremes

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, † represents two days, etc.

* Also on other dates. ** Received too late to be included in means and summaries.

¶ Post-office addresses.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

T. Precipitation is less than 0.01 inch rain or melted snow.

§ Lone Oak.

---

near Jeffersontown. The path of the second storm was about four miles south of the path of the first. The damage in both storms was estimated at $20,000. One person was seriously hurt and brothers sustained minor injuries. In both storms the funnel-shaped cloud, which at times reached the ground, left a path of scattered destruction from one to two hundred yards wide and several miles long. Trees were uprooted or broken off, and buildings were unroofed or blown down. In some instances only kindling wood remained of the buildings. The path of the storm was about 15 miles long and 200 yards wide.

Jan. 24.—A windstorm that traversed Ballard and McCracken Counties, affecting the towns of Wickliffe, Kevil, Gage, Lamont, and Paducah, caused damage estimated at $100,000. Many buildings were unroofed or blown down, and trees were uprooted or broken off. The path of the storm was about 200 yards wide and 15 miles long.

Jan. 24.—A windstorm that traversed Ballard and McCracken Counties, caused damage estimated at $10,000. This fact may explain the relatively light damage and casualty list. A windstorm in Daviess County caused damage to buildings and trees estimated at $50,000.

Daily Precipitation for January, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIII LOUISVILLE, KY., FEBRUARY, 1928 No. 2

GENERAL SUMMARY.

As in the month preceding, temperatures continued changeable, with marked variations from the seasonal averages. Cold weather on the first two days was followed by two weeks in which temperatures above normal predominated, but with occasional sharp freezes and much heaving of the soil. In the last half of the month low temperatures were the rule, but there were occasional complete thaws followed by deep freezes. There was no snow cover of consequence. Precipitation much less than normal permitted some improvement in the drainage of the lighter soils and lessened somewhat the injury to grass and grains from the lifting freezes. The precipitation was sufficiently frequent, however, to keep the clay lands wet enough to offset their slow drainage; hence progressive injury to wheat continued in such districts, and was responsible for extensive damage. In other sections, including much of the blue grass region, the winter killing of wheat appeared to be less serious than on the central uplands; although there was general complaint as to its unsatisfactory condition. The marked variation in the effect of the weather on this crop was due mainly to the difference in the manner in which the soils of the State react to such extremes of temperature as have been experienced during the past winter. While the variable temperatures have been continuously unfavorable for wheat, the light precipitation has been advantageous. Freezes were so frequent that no growth of consequence occurred. At the end of the month fruit buds and other vegetation were entirely dormant. Temperature conditions contributed to the deterioration of dirt and macadamized roads. On the sandy lands of the western counties some plowing was accomplished, but in the main temperatures were too low and the soil was too wet for much progress with this work or in sowing of tobacco plantbeds.

TEMPERATURE.

The temperature for the State, 45 stations reporting, averaged 38.1°, which is 2.1° above normal. In the warm period near the beginning of the month mean temperatures were 10° to 20° above normal on several days, and maxima ranged between 60° and 70° at most stations. Deficiencies of nearly equal magnitude occurred on the 18th, 19th, and in the period 24-26th. The extremes for the State were 72° at Williamsburg on the 4th, and 5° at Williamstown on the 26th.

PRECIPITATION.

Precipitation for the State, based on reports from 84 stations, averaged 2.48 inches, which is 1.05 inches less than the normal for February. The distribution was quite irregular for a winter month. There were large areas in which 3.0 to 3.5 inches occurred, in the western half of the State, and a few small districts that received more than 3.0 inches in the Licking Valley. In most of the eastern half of the State, and also in several western counties, amounts ranged between 1.5 and 2.5 inches. In general precipitation decreased from the Purchase toward the eastern mountain section. The extreme amounts were 4.16 inches at Murray and 0.88 inch at Whitesburg. Light to moderate precipitation occurred in the periods, 5-9th, 13-19th, and 22d-24th. Snowfall was light and mostly melted as it fell. Most of it fell on the 17th, 18th, and 29th. At several upland stations in the northern counties total amounts ranged between 1.5 and 3.0 inches. Sleet was reported on the 14th, 15th, 17th, 23d, and 29th; and thunderstorms on the 6th, 14th and 23d.

State averages and extremes											2.48	−1.05	1.80	1.0	10	11	4	14	sw.	

All temperature data are taken from self-registering thermometers.

3 — departure from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section, or division means

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc

‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

T Precipitation is less than 0.01 inch rain or melted snow

§ Lone Oak, Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

* Also on other dates.

† Received too late to be included in means and summaries

¶ Post-office a Briggs.

MISCELLANEOUS.

The Ohio River was comparatively low at the beginning, but rose to moderate [illegible] the second week, and continued in that condition until the end of the month [illegible] the Ohio were rather low for late winter.

Daily Precipitation for February, 1928.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi. ¶Lone Oak

Daily Temperatures for February, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

Vol. XXXIII LOUISVILLE, KY., MARCH, 1928 No. 3

GENERAL SUMMARY.

Although the temperature for the month averaged near normal, the periodic sharp variations characteristic of previous winter months continued. Freezing and thawing during the first two weeks caused further injury to winter grains. With this exception, temperatures were more favorable than otherwise, for the frequent and sharp cold spells served to prevent premature growth and to retard the flowering of fruit trees. A few days in the last decade, with temperatures much above normal started grasses and grains to growing and caused buds to expand. Peaches and plums began to blossom near the end. The beginning of growth indicated that the damage to winter wheat was even more extensive and serious than had been anticipated. Large and numerous bare patches in the fields, plants weak and thin on the ground, with irregularity or failure in stooling, revealed the poor condition of the crop and the probability that an unusually large proportion of it would be plowed up. Insufficient time to root deeply, due to late sowing last fall, was partly responsible for the damage to wheat. Because of the tendency to abandon wheat, less grass seed than usual was sown. Rye, alfalfa, clover, and bluegrass also exhibited marked winter injury. The light precipitation permitted the soil to drain thoroughly and reach working condition early in the month. As a result of the deep freezes and absence of heavy rains, the soil worked exceptionally well. The number of days favorable for outdoor work was somewhat larger than usual in March. Plowing, potato planting, oats sowing, and early gardening proceeded more rapidly than normal and were generally ahead of the season at the end of the month. By that time much land in the western counties had been prepared for corn and cotton, with prospects good for early planting. Tobacco beds were sown in good time, and plants were coming up in the last week.

TEMPERATURE.

The temperature for the State, 44 stations reporting, averaged 46.6°, which is 0.8° below normal. Minima at most stations occurred in the cold period with which the month began, but temperatures almost as low were registered in the 3d week. Maxima of 75° to 85° were recorded at most stations in the periods 11-13th and 22d-25th. The highest for the State was 86° at Beaver Dam and Marion, on the 20th and 21st respectively; while the lowest was 12° on the 1st at Shelbyville.

PRECIPITATION.

Precipitation for the State, based on reports from 85 stations, averaged 2.64 inches, which is 2.20 inches below normal. It was heaviest and not far from the normal in the mountains and southeastern counties, where it ranged between 3.0 and 5.0 inches at most stations. The amount decreased irregularly toward the Ohio and Mississippi Rivers, ranging in central and northwestern counties from 1.5 to 3.0 inches. Moderate to heavy precipitation occurred rather generally in the period 14th-16th in the western counties, and from the 14th to 18th in the central and western counties. Much of this was snow, which varied in amount between flurries in the western counties and 3.0 to 7.0 inches in the central and eastern. Light to moderate precipitation occurred fairly generally on the 1st, 9th,

UNIVERSITY OF ILLINOIS

26-27th, and 30th. Thunderstorms were reported on the 8th, 9th, 13th, 26th, 29th and 30th. Hail occurred at several stations on the 26th. It caused considerable damage at Williamsburg.

State Averages and Extremes				45.6	0.8	85	29†	19	1†	54										

All temperature data are taken from self-recording thermometers.
The departures from normal temperatures and precipitations are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak
¶ Post office addresses. Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

March 9.—A windstorm destroyed a house and injured its four occupants near W
March 14.—Near Hawesville a young man, sitting before an open fireplace, was Point. Wind and electrical storms caused minor damage in Bourbon and Jessamine
March 15.—Ohio normal temperature of the month was reached. Hail of moderate quantities.
March 16.—Ohio normal temperature of the month was reached. Rivers.—Moderate stages prevailed during the month.
March 17.—Near Lexington a tornado destroyed

Daily Precipitation for March, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

L XXXIII LOUISVILLE, KY., APRIL, 1928 No. 4

GENERAL SUMMARY.

Decidedly warm weather prevailed in the six-day period at the inning of the month. After that temperatures were below mal nearly every day, while in the periods central about the , 15th, and 27th, departures were 10° to 15° below the sea- al average. The early warm spell caused peaches and plums blossom completely in the southern counties and partly in the thern. The freezes of the 10th and 16th damaged these its considerably, killing some buds outright and causing the t to drop in the case of others that were more resistant. In northern counties a considerable percentage of buds, which not opened, escaped apparent injury. The continued cold t other fruits semi-dormant and safe from damage. Some ng clover, especially that sown on winter killed wheat, was ght in the "double" and killed. Early gardens were planted erally in the warm spell, but the unfavorable weather later prevented much progress. Although land was generally dy or in condition that it could be prepared promptly, most ners awaited more favorable temperatures before planting n. With the rise of the temperature to normal on the last days, planting was pushed vigorously in all districts under ditions of soil and weather that permitted the most rapid gress. Precipitation, somewhat heavier than normal, inter- d at times with plowing, but this work was already so well anced that such delays were generally immaterial. Excess- downpours locally in some western counties caused damage soil washing, otherwise the rains were beneficial in supplying itional moisture to soil somewhat drier than desirable at this on. Oats came up to a good stand of fairly vigorous plants, growth was very slow. Tobacco plants also developed dly and were inclined to turn yellow. Wheat continued in r to very poor condition, with irregular growth and weak rts at stooling. In the eastern counties nearly all of it was ndoned or plowed up. The condition of the wheat crop at end of the month was decidedly the worst in many years. dows, clover, alfalfa and pastures, made exceptionally slow irregular progress in starting.

TEMPERATURE.

he temperature for the State, 43 stations reporting, averaged °, which is 3.0° below normal. Minima below freezing rred with unusual frequency, while the average monthly ima at many northern stations was only 6° to 8° above ing. A peculiar temperature feature was the occurrence of warmest weather at the beginning of the month, when ima of 80° were registered at some western stations. Ex- es for the State ranged between 83° on the 2d at Williams- , and 21° on the 16th at Farmers and Junction City.

PRECIPITATION.

recipitation for the State, based on reports from 83 stations, 4.20 inches, which is 0.17 inch above normal. The heaviest ipitation occurred in the extreme western and southeastern ties, where it ranged between 5.0 and 7.5 inches. In the rict along the Ohio River from 4.0 to 5.0 inches was recorded ost stations. In a broad northeast-southwest belt through center of the State, amounts ranged between 2.5 and 3.5 es. Light to moderate rain occurred on the 7th in the ral and eastern counties, and heavy rains in the western ion. There were also heavy rains locally on the 14th and 21st. They were excessive on the 21st in some western districts. Showers occurred from the 18th to 28th, but amounts were irregular and the distribution was local on most days. Heavy snow was reported from a few southeastern mountain counties on the 27th and 28th. Thunderstorms were noted on the 3d, 6th, 13th, 18th, 19th, 20th, 21st 23d, and 24th, principally in the western and central districts. No hail of consequence was reported.

All temperatures here are taken from self registering thermometers.

The departures from normal temperatures and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published.

a Hennessy, Brownsville and Woodbine are Locks on the Green River; other Locks are on the Kentucky River.

b Dates on which readings are also given.

Reference letters, * appearing in the table indicate number of days missing; for example, 5 represents five days, etc.

Reference letters, * appearing in the table indicate number of days missing; for example, 5 represents five days, etc. † Trace of precipitation is less than 0.01 inch rain or melted snow. ‡ Lone Oak.

* Also on other dates. ** Record of two late to be included in means and summaries. †† Temperature is below zero. ‡‡ Record of two dates.

MISCELLANEOUS.

destroyed at $35,000.

April 21.—Several barns and other buildings were partly or entirely unroofed by a windstorm in Garrard County, with a damage estimated at $20,000.

Rivers.—Moderately high stages prevailed in the Ohio during the month. There were no rate rises in the headwaters of the Green, Cumberland, Kentucky, and Big Sandy during the first week.

Daily Precipitation for April, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

L. XXXIII LOUISVILLE, KY., MAY, 1928 No. 5

GENERAL SUMMARY.

The month began with a brief period of warm weather, but on the 5th to the end temperatures below the seasonal average dominated. The continued low temperatures in conjunction th the dry weather that prevailed during the first two weeks, used further retardation in the growth of practically all crops. rn came up slowly and early plantings frequently showed or stands. This was due partly to bad seed as well as unfa-rable temperatures. Extensive replanting was necessary, es-cially on the heavier soils. The seeding of cotton was affected the same way, but not so seriously because of the larger ount of sunshine and somewhat higher temperature in that atively dry district. In the northeastern counties the dry ther continued throughout the month, and reached the con-ion of incipient drought. In that section pastures became rt and all early crops were much delayed. Seed bluegrass, h its short stems and poor heads, showed the effects of de-tion of soil moisture and winter injury. The heavy rains of 15-17th, which reached all parts of the State, except the theastern and southwestern counties, furnished much needed isture and greatly accelerated growth. Tobacco plants made y slow and irregular progress until the rains, after which y grew rapidly and reached transplanting size in the best s a few days before the end of the month. Setting began ut the middle of the last week. Oats showed marked im-vement after the rains. The wheat that remained, almost of it in the western counties, improved slowly but headed gularly. Its condition continued generally unpromising. cept for some irregularity in size, potatoes made satisfactory gress and were well cultivated. Strawberries were good, but wers interfered with marketing. Old clover, timothy, and lfa improved slowly, but were weedy and spotted. Alfalfa shed the cutting stage in the showery period toward the end he month, when the weather was unfit for curing. Gardens truck developed slowly, with only the cool weather vegeta-making anything like satisfactory growth.

TEMPERATURE.

The average temperature for the State, as derived from the orts of 43 stations, was 63.2°. Although this average is siderably below normal, it is still much higher than the ins of two of the last five Mays. Maxima were rather low, cially after the first week. Minima touched freezing on the and 13th at a few stations, but without injury to vegeta-. The periods of subnormal temperature were rather long, le those with temperature excess were notably short. The mes for the State were 94° at Quicksand on the 3d and at Farmers on the 8th.

PRECIPITATION.

s determined from the records of 82 stations, precipitation the State averaged 3.55 inches, which is 0.42 inch less than mal. Its outstanding feature was the remarkable regional ation. In the northeastern counties near the Ohio River total for the month was about 1.5 inches, while directly ss the State in the border counties it was 6.0 inches or e. Marked local irregularities also appear, especially in the ral districts, where amounts at nearly stations differed by to 3.0 inches. Over most of the State amounts ranged be-n 3.0 and 5.0 inches. Light scattered showers occurred on a few days in the first two weeks. Moderate to heavy rains prevailed generally over the State in the period 15th-22d and again from the 25th to 27th. These were very heavy locally on the 17th, 18th and 26th. Thunderstorms were reported on the 11th, 16th, 17th, 18th, 19th, 21st, 25th, 26th, 27th and 30th. Precipitation on these days was 0.94 inch at Maysville and 6.99 inches at Williamstown.

State averages and extremes				63.2	− 2.4	94	3	29	8	56										

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are included in determining extremes and means. ‡Ramsey, Brownsville and Woodbury are Lock 5 on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, etc., refer to footnotes 2 in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

a Also on other dates. b Reported too late to be included in means and summaries. †Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

a Also on other dates. b Reported too late to be included in means and summaries. †Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

a Also on other dates. ** Reported too late to be included in means and summaries. ‡Locks 4 Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

¶ Post-office addresses—Lock 5, Georgetown, Ky.; Lock 8 Versailles, Ky.; Lock 4 Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

May 27. Hail damaged for destroyed strawberries near Pembroke, Christian County.

MISCELLANEOUS.

Many [illegible] throughout the State during the month. Some tobacco plantbeds were also ruined.

[illegible] Rear Admiral [illegible] visited the sitting room of [illegible] Ohio, which were rather high at the beginning of the month.

[illegible] Near Smithville, Jessamine County, a [illegible] killed by lightning fell on him [illegible] practically to pod stage toward the close.

Daily Precipitation for May, 1928.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

* Reference mark *** Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. † Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking (K) Kentucky (G) Salt (GG) Green (C) Cumberland (T) Tennessee (OO) Ohio; (M) Mississippi.

¶ Lone Oak

ERRATA.

December 1927: Hindman precipitation on 7th, .76; on 8th, 2.15; on 12th, .90; total from normal —6.5. April 1928: Lexington precipitation on 27th, .04; total for month, 2.78; departure from normal, —.95; section average precipitation, 5.62. Annual average, days partly cloudy, 146; clear, 110. Extreme highest temperature, 97 on 5th. Mean mean temperature, 57.71. Mean daily lowest temperature, 25 on [illegible]

Daily Temperatures for May, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIII LOUISVILLE, KY., JUNE, 1928 No. 6

GENERAL SUMMARY.

Precipitation of extraordinary quantity and frequency largely prevented outdoor work, and caused much damage from flooding of lowlands, washing of soil, and drowning of crops. Probably not in the climatic history of the State has excess of rain resulted in more injury to agriculture. Cultivation was possible only at rare intervals and for brief periods, sometimes merely for a few hours; hence weediness increased to such proportions that many fields with poor drainage were overwhelmed and had to be abandoned, with the possibility of replanting later in other crops. On the eastern and central uplands, particularly in the bluegrass region and northeastern counties, enough cultivation was accomplished during a few fair days at the beginning of the month to check the weeds and grass in a part of the crop, but a considerable proportion of corn and tobacco received no cultivation during the month. Despite the subnormal temperature, growth of all crops on well drained uplands was fairly good. On the water-logged soils of the central and western counties, where the rain was heaviest, growth was poor or there was actual deterioration. Weather conditions delayed the ripening of wheat. Harvest commenced in the southern counties during the last week, with boggy fields, daily showers, and insufficient sunshine to cure it. Oats made a finer crop than usual, but there was a tendency to rankness and falling. The persistent rains favored tobacco setting and resulted in a stand practically perfect and even in size. Potato vines grew rank, but tubers were small or slow in forming. Hay harvest of any kind was practically impossible, and little could be done in gathering and curing bluegrass seed. The rain damaged strawberries in the fields and seriously interfered with picking and marketing. Cotton was small and almost hopelessly weedy at the end of the month.

TEMPERATURE.

The average temperature for the State, determined from reports of 44 stations, was 69.5°. This was 4.5° below normal, and next to the lowest of record, the exception being June, 1903, with a mean temperature of 68.6°. The subnormal temperature was due largely to low maxima caused by cloudiness. Daily means up to or above the normal occurred only two or three times. Extremes for the State were 98° at Williamsburg on the 19th, and 45° at Farmers and Middlesboro on the 8th.

PRECIPITATION.

Based on reports from 83 stations, precipitation for the State averaged 10.88 inches. This is 6.79 inches above normal, and, with the exception of the average of 11.41 inches in January, 1913, it is the highest of any month since state records were established. In the western division the average was nearly 13.0 inches; in the central more than 11.0 inches; and in the eastern about 8.5 inches. Rain in appreciable amount was recorded on every day in the month. Heavy to excessive rains were general on the 4-5th, 9-10th, 18th, 20th-21st, and 27-29th; and were local on many other dates. Two short periods of scattered showers on the 1st-3d and 15-17th offered practically the only intermission in a month of continuous daily rains. In most of the district west of the Kentucky River amounts ranged between 10.0 and 18.0 inches. In a broad belt through the central counties from 12.00 to 15 inches occurred. The district northeast of the Kentucky River received from 7.5 to 10.0 inches, and a few southeastern mountain counties from 4.0 to 6.0 inches. Extremes for the State were 3.57 inches at Sergent, Letcher County, and 9.22 inches at Paducah. Thunderstorms were reported on 18 days.

MISCELLANEOUS.

June 12. Near Mt. Sterling one man was killed and three others injured when lightning struck a tree under which they had taken shelter.

June 18. Houses and barns were unroofed by a windstorm near Franklin.

June 19 Buildings at Fairview were damaged by a windstorm and several head of cattle were killed by lightning.

June 21. A mountain torrent, swollen by excessive rain, swept into Irvine, causing much damage to the business district.

June 24 In Kenton County a boy was drowned by a sudden freshet that swept down the nearly dry bed of Bullock Pen Creek.

June 28-29. Excessive rains, falling on a terrain already wet, caused extensive damage in many districts The bluegrass region suffered severely, the loss in that section alone being estimated at nearly a million dollars. In Lexington, where 5.50 inches fell in less than 24 hours, basements were flooded and stocks of merchandise ruined The loss here was probably $300,000. In Fayette County outside of Lexington, the damage was placed at a like sum. Highways and interurban lines were washed out in many places; but the greatest damage, which can not be estimated, was sustained by lands and crops. Even on short slopes of slight descent the soil was badly washed, while low land crops were generally overflowed and washed out or buried in the mud. It is believed that the loss in the bluegrass region to all kinds of property will reach

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

+ Also on other dates. ‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

§ Lone Oak. ¶ Received too late to be included in means and summaries. ** Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

† Precipitation is less than 0.01 inch rain or melted snow.

$1,000,000 or more. Other cities specially affected were: Madisonville, Lawrenceburg, Menifee, Morgan, Elliott, Powell, Lawrence, Johnson, Martin, Floyd, Magoffin, Wolfe, Lee, Owsley, and Estill, more than 3,600 families were affected and probably 10,000 acres of crops were flooded and washed away. The damage in this district in the destruction of homes, crops, bridges, roads, and drowning of stock could not be estimated, but was evident, more than $1,000,000, while the value of the eroded or ruined

Terra Marble, Mt. Sterling, Nicholasville, Winchester and Versailles. A loan was granted in Flat Creek, at Ellston. In the mountain counties eastward from the Cumberland section floods along creeks caused enormous damage to buildings, crops, lands and roads. In the counties of Bath, Fleming, Lewis, Greenup, Carter, Rowan,

Daily Precipitation for June, 1928.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (x) Salt; (G) Green. (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi. ' Lone Oak.

and was also very large.

The damage to crops from the prolonged June floods along the Green and lower Ohio rivers was roughly estimated at $2,000,000 or more. It was estimated that 4,000 families were affected and 50,000 acres or more of crops inundated in the western counties.

Rivers.—The rains of the 28-30th caused exceptionally high stages for the time of year in the Ohio and some other streams. At the end of the month the Ohio was approaching flood stage and still rising from Evansville to Cairo. The Green crested from 4.0 to 6.0 feet above flood stage in the section between Woodbury and the mouth, and was also slightly above flood at Brownsville. This flood in the lower Green continued from the 9th to 25th. It was again above flood and rising from Woodbury to the mouth at the end of the month.

Daily Temperatures for June, 1928.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

L. XXXIII LOUISVILLE, KY., JULY, 1928 No. 7

GENERAL SUMMARY.

Heavy rains that occurred in the first two weeks in the central d eastern counties caused further delay in cultivation. Some rn became too large to be cultivated, while other corn on toms and flat land became so foul that it was abandoned as peless. Dry weather and moderate temperature during the t two weeks, and in the western counties for three weeks or re, were generally favorable for crops and farm operations. ward the end of the month, however, the need for rain was dent in the western counties and some other districts. This d was due less to lack of precipitation than to conditions wing out of the preceding wet weather. The packed soil ed hard because all crops could not be worked quickly; also superficial root systems of early corn and tobacco were gely destroyed by cultivation, to be followed by yellowing and ring," with symptons of drought. Much corn with only one wing, and that given with difficulty because of the large size he plants, was left weedy and grassy. Such corn was soon fering for moisture. Tobacco was not so far advanced that tivation was impossible, but in only a small part of this crop, well as corn, could the work be done at the proper time. acco was therefore cleaned much better than corn and fered to a less extent from yellowing and the stunting effect lamaged root systems. Wheat harvest was completed with iculty, but fair weather later caused the shocks to dry out. s and hay harvest were carried on under favorable condi- ns. The first, and in some cases the second crop of alfalfa cut and cured. Potatoes, gardens, truck and field tomatoes proved decidedly under the influence of the sunshine. The weather also caused marked improvement in cotton, though crop remained far behind.

TEMPERATURE.

Reports from 43 stations gave an average temperature for the nth of 77.0°, which is near normal. Except for a few cool s near the middle and end of the month, temperatures de- ted only slightly from the normal. Maxima were generally derate for this month. The extremes were 100° at Middles- o on the 11th and 50° at Dix Dam on the 29th.

PRECIPITATION.

As determined from the records of 82 stations, precipitation the State averaged 4.07 inches, which is slightly less than rmal. The distribution was remarkably irregular, with ex- ordinary divergence between the amounts received in the dry l wet districts. In most of the western division amounts ged between 0.4 inch and 3.0 inches, several counties between lower courses of the Green and Cumberland received less n an inch. In the Bluegrass region and Kentucky River ley amounts varied between 4.0 and 8.0 inches. From 3.0 5.0 inches occurred in the upper Green River Valley, and to 4.0 inches along the Middle and upper Ohio and in the ern border counties. Extremes for the State were 0.45 h at Marion and 9.80 inches at Frankfort. The rains were inly local in character, and often excessive and damaging to and crops. They occured in most districts in the periods th, 8-14th, 19th-23d, and 27-28th. Thunderstorms were orted on 14 days.

MISCELLANEOUS.

Near Mayfield a child was killed by lightning on the 6th while standing in the open, and a man on the 13th whilk working in the field.

State averages and extremes		....	....	....	....	....	....	....	....	....	....	....	....	....	....	....	....	....	....	....

All temperature data are taken from self-registering thermometers.

Dashes indicate record not taken; estimated or incomplete. Averages are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or district means.

Departures from normal (means entered in record for the month) are computed for the same number of years as the means.

Figures in parentheses, thus (3), in connection with the data indicate number of days missing; for example, 5 represents two days, etc.

Letters a, b, c, etc., appearing in the table indicate number of days missing; for example, 5 represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow. [illegible] Lone Oak

[a] Record for less than full month. [illegible] Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River. [illegible] Scott, Independence, Ky.

[b] Also on other dates. [illegible] Received too late to be included in means and summaries. Locks 5, Nicholasville Ky.; Lock 10, Red House Ky.; Lock 11, Heidelberg, Ky.

[c] Part of the address: 8.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 9, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

July 7.—A rather brilliant and unusual display of aurora borealis was seen in the [illegible] ordinary accumulation of water in the streets, sometimes as much as four feet in dept

July 13.—Excessive rains caused further damage in Fayette, Clark, Madison, M

July 15.—A storm visited the [illegible] counties, causing 3 1-2 hours in Franklin and Woodford counties. [illegible] cer, and Nicholas counties to cross and land. Basement were again flooded at Le

July 16.—Excessive rains [illegible] damage to crops and roads. One bridge [illegible] inston.

July 26-27.—A crest of 29.5 feet occurred in the Kentucky River at Frankfort on the [illegible] age over-flowed the local [illegible] and 30.1 feet in the Ohio at Cloverport on the 4th, both slightly under flood sta

July 28.—Excessive rains [illegible] The loss was estimated at $50,000. At Frankfort, where the rain-[illegible] fall was 4 inches, basements and lower floors of buildings were flooded by the extra-[illegible] ordinary rainfall.

Daily Precipitation for July, 1928.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

‖ Co-operative mark (*). Regular Weather Bureau station, precipitation is for the 24-hour period, midnight to midnight.

¶ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Seepage data of falls not recorded. T. Trace, or less than .005 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (Sc) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

*Lone Oak.

st in the Green were as follows: Munfordville 30.4 feet on the 1st; Woodbury 39.1 drove motor out in the low bottoms. In the Evansville district, which includes the Green to Ohio at above flood, on the 24; Ramsey, 38.3 feet, 4.3 feet above flood on the 4th; and the Cumberland section the Ohio at Smithland reached 38.4 feet, 3.4 feet above flood, on the 6th. This is the Wabash, it is estimated that 41,550 acres of crops were submerged with a loss of It also had a record in the Evansville district. The Ohio was also slightly above flood stage at Cairo, 40.2 feet, 2.2 above flood stage at Paducah and Cairo, and the Mississippi was at flood stage along the west border. The damage was nearly all to growing crops, which were overflowed and

Additional losses in the Cairo district will raise the amount to a total of at least $2,000,000

Daily Temperatures for July, 1928.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIII LOUISVILLE, KY., AUGUST, 1928 No. 8

GENERAL SUMMARY.

Temperatures averaging somewhat above normal, and without marked extremes, favored the progress of all crops. Precipitation was generally sufficient for the needs of vegetation in the eastern and central counties; but incipient drought of more or less severity, depending largely on character of soil and exposure, prevailed in most of the western division. The total rainfall at some western stations for the six weeks preceding the rain at the close of this month was only about 2.0 inches. Corn "fired" irregularly but quite extensively in the dry district, with considerable resulting injury; while the growth of tobacco and cotton was retarded. Crops on hillsides and thin lands in the central counties also suffered at times from dry weather. In some eastern localities there was complaint of too much rain. This favored the development of rust on tobacco which resulted in premature ripening. Cutting began about the middle of the month, and had made considerable progress by the end. Weather conditions were favorable for housing and the beginning of the curing process. Because of the dry weather in the western districts, corn that was planted after the cessation of the June rains grew so slowly as to make its maturity problematical. Cotton also made slow progress, partly because of delay in cultivation and partly on account of dry weather. Showers in that section late in the month were beneficial to the crop; but were not heavy enough to entirely relieve the droughty conditions. Pastures continued good in the eastern half of the State and the upper Green River Valley, but they dried rather generally westward. Except in some eastern localities, there was little interference by rain with threshing and haying. Field tomatoes, gardens, and truck suffered for rain in the western counties. Conditions were favorable for handling fruit.

TEMPERATURE.

Based on reports from 43 stations, the average temperature for the State was 77.0°. This is 1.4° above normal, and the same as the average for July preceding. Except for a few brief intervals, daily means were generally above normal. Moderate maxima were the rule; but minima above normal predominated, with warmer nights than usual in this month. This feature of the temperature hastened the maturity of corn. The extremes were 101° at Quicksand on the 7th, and 54° at Greensburg and St. John on the 23d.

PRECIPITATION.

The records of 80 stations gave a precipitation average for the State of 4.33 inches, which exceeds the normal by 0.62 inch. In the western third of the State, and in some extreme northern counties, between 1.5 and 3.0 inches occurred. In the central and eastern districts, precipitation ranged from 4.0 to 6.0 inches, and was generally in excess of normal. A few localities in the south-central and eastern counties received from 6.0 to 7.5 inches. The 1st-8th constituted a local shower period, in which heavy rains occurred in places. Showers were fairly general and often heavy in the periods 16-19th, 23d-25th, and 30th-31st. Extremes for the State were 1.60 inches at Earlington and 7.35 inches at Eubank. Most of the showers were attended by thunder, which was reported on 12 days.

MISCELLANEOUS.

Aug. 10. A farmer was killed by lightning near Somerset after taking refuge in a barn. Lightning killed a horse and burned a barn near Lafayette, Christian County, and burned a barn near Judy, Montgomery County.
Aug. 14. Lightning burned a residence at Cadentown.
Rivers.—The usual summer stages, with no important fluctuations, prevailed in the Ohio and tributary streams.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
‡ also on other dates. †† Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
* Post office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, N. Middlesville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Daily Precipitation for August, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIII LOUISVILLE, KY., SEPTEMBER, 1928 No. 9

GENERAL SUMMARY.

The month was exceptionally cool and dry, with conditions favorable for the maturing and harvesting of the early crops and favorable for the growth of those planted late. In most of the agricultural section of the State, precipitation was so light as to be of negligible importance. The showers that occurred near the end of the month were generally light local, and insufficient to break the prevailing drought, which by this time had spread to the central and eastern counties. In the western counties the soil became so dry and hard early in the month as to prevent preparation for fall seeding; while toward the end of the month the same condition prevailed in central and eastern districts. Some rye, sown early in the month, came up and perished because of diminished moisture. Other rye, sown later, failed to germinate. In the last days, some wheat was sown locally, following the showers; but without sufficient moisture to insure growth. The fair weather, sunshine, and low humidity were very favorable for cutting, housing, and curing tobacco. With most of the early crop there was no interference of consequence by weather from the beginning to the end of harvest. Early corn dried rapidly and cutting proceeded under ideal conditions. Late corn, tobacco, hay, and truck crops were retarded by drought and low temperature. In the western counties late corn and tobacco "fired" extensively, pastures dried up, and other crops deteriorated. Maturity of early cotton was hastened. Shortage of water for stock and domestic purposes appeared in places. Heavy frost, causing extensive damage to late crops, occurred on the 24th; and killing frost, the earliest of record in the State, was reported from most districts on the 26th. This freeze ruined considerable late corn and tobacco, generally that which was planted in the western counties after the late spring and early summer wet spell; but early tobacco, which included nearly all of the crop in the Burley district, and also most corn of importance in the production of grain had already matured. Late potatoes were practically a total loss, and late forage crops also suffered.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 43 stations, was 65.5°. This is 4.8° below the September normal, and among the lowest averages on record for this month. Except for about a week, mainly in the second decade, average daily temperatures were almost continuously below normal. Daily deficiencies in the last decade ranged from 8° to 26° in most districts. Temperatures of 25° to 32° were reported quite generally on the 26th. The extremes were 99° at Middlesboro on the 10th and 24° at Farmers on the 26th.

PRECIPITATION.

Reports from 82 stations gave an average precipitation of 0.81 inch, which is 2.66 inches less than the established normal for this month. Except in 1897, this is the lowest precipitation average for the month of September ever recorded in the State. From an area in the southeastern part of the State, limited to a few counties, where 3.0 to 4.0 inches occurred, precipitation decreased rapidly toward the west. A few western counties reported no rain during the month. In the western half of the State amounts ranged from a trace and 0.6 local best stations. In the central counties from 0.2 to 1.0 is reported, while eastward and eastward there was no irregular increase to 1.5 inches at some stations. Moderate to heavy showers occurred on the coast on the 25th and light to moderate showers in the central and eastern districts on the period 27-30th. There were only a few scattered showers in the western counties. Thunderstorms were reported from a few local ties on the 6th, 14th, and 29th.

MISCELLANEOUS.

Sept. 29.—A barn was burned by lightning near Dry Ridge, Grant County.

Rivers.—Low stages prevailed in all rivers during the month.

State averages and extremes																				

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or district means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, † represents two days, etc.

[a] Also on other dates. [f] Received too late to be included in means and summaries.

[5] Post office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

T. Precipitation is less than 0.01 inch rain or melted snow. g Lone Oak.

Daily Precipitation for September, 1928.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

( ) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Several dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

* Lone Oak

Daily Temperatures for September, 1928.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIII LOUISVILLE, KY., OCTOBER, 1928 No. 10

GENERAL SUMMARY.

The period of dry weather and high temperature that extended into the third week, favored the curing of tobacco and drying of corn, with corresponding excellence of condition in the case of both crops. This dry weather interfered seriously with soil preparation and seeding and also retarded or prevented the germination of grain already sown. It had the effect of postponing the seeding of wheat, which could not proceed in the drier districts until after the general rains early in the third week, and was not completed until the last week. Much of this wheat had just come up at the end of the month. Abnormally cool weather in the last week, culminating in frosts and freezing temperatures toward the end, retarded growth at a time when late sown wheat needed excess warmth to hasten development and strengthen the plants for resistance to winter. Showers in the northern counties early in the month resulted in prompt germination and satisfactory growth. Droughty conditions were not relieved in all districts until the general rains early in the third week. The growth of the last crop of alfalfa corresponded largely to the distribution of the early showers, otherwise the dry weather reduced this cutting. Weather for cutting was exceptionally favorable during the first two weeks, but less so thereafter on account of low temperature and cloudiness. In the extreme western counties and in some southern districts, where vegetation was damaged but not killed by the September frosts, some late corn and potatoes matured partial crops. Except in brief periods of rain, weather conditions favored cotton picking. Pastures recovered locally in the northern counties, stimulated by the showers and high temperature; but they remained short in other districts until after the general rains, with considerable feeding necessary. By the end of the month pastures had revived generally to such an extent as to furnish considerable grazing. The rapid and complete drying of corn led to early gathering and more than the usual progress. The weather favored the handling of fruit and other fall products.

TEMPERATURE.

Reports from 41 stations gave an average temperature for the state of 61.6°, which is 3.5° above normal. Relatively high temperature, with occasional maxima of 90° or above, prevailed from the 2d to 18th inclusive. With the exception of one or two days, temperatures were continuously below normal during the last decade, with daily deficiencies on the 29th and 30th ranging from 10° to 14°. These low temperatures were practically the same as those near the end of September preceding. Extremes for the State were 95° at Hopkinsville on the 10th, and 21° at Farmers on the 30th.

PRECIPITATION.

The average precipitation, based on reports from 81 stations, was 3.93 inches, which is 1.23 inches above normal. The rainfall was heaviest in the western and central counties, where it ranged between 4.5 and 7.0 inches; and lightest near the eastern border, where it varied generally between 2.0 and 3.5 inches. A part of the northern bluegrass district received from 3.0 to 3.5 inches, but in nearly all of the area from the Licking and upper Kentucky basins eastward and southward only 2.5 to 3.5 inches occurred. There were light to moderate showers in the periods 2d-5th and 27th-28th. Moderate to heavy showers occurred quite generally in the periods 15-18th and 22-23d. Amounts at the various stations ranged between 0.86 at Pineville and 7.11 inches at Leitchfield. Thundershowers were reported on the 2d, 3d, 5th, 11th, 16th, and 17th.

State averages and extremes

a 23 temperature data are taken from self-registering thermometers.

b Temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. c Departure from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River. d Departure from section or division mean. e Prevailing direction of days missing; for example, s represents two days, etc. f Precipitation is less than 0.01 inch rain or melted snow. g Lone Oak. Reference letters [a], [b], [c], appearing in the table indicate number

Daily Precipitation for October, 1928.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

APR 2 1930 1929
UNIVERSITY OF ILLINOIS

VOL. XXXIII LOUISVILLE, KY., NOVEMBER, 1929 No. 11

GENERAL SUMMARY.

While the temperature for the month averaged near normal, the relatively cool days outnumbered those that were warm and favorable for growth. Fall grains had generally received a poor start because of the dry weather in the preceding month, therefore the cool cloudy weather of November had the effect of preventing such growth as would have produced free stooling, deep roots, and sturdy development suitable for resistance to winter conditions. In the northern counties, where the early supply of soil moisture was sufficient, grains had made fairly satisfactory progress and had reached such a stage in most fields that the weather of this month had no important effect. The cold spell in the last week, with temperatures ranging from 10° to 0°, rendered most vegetation dormant for a time, with but little growth thereafter. Pastures continued to make some growth until this cold period, furnishing grazing in most districts sufficient to maintain stock without much feeding and to keep milk production up to a high standard. In the southwestern counties, which suffered most from the fall drought, pastures failed to fully recover, largely because of the retarding effect of the frequent frosts and temperatures of freezing or lower that occurred in the last three weeks. Precipitation below the average was more favorable than otherwise, but its frequency interfered considerably with the gathering of corn. On the other hand this feature of the weather favored tobacco stripping, which proceeded rather more rapidly than usual and resulted in some marketing late in the month. By the close of the month most corn had been cribbed. The heavy rains late in the month, and the softening of soil following the freezes, prevented completion of this work. Meadows, clover, and alfalfa continued their slow recovery. Dirt roads remained in good condition until the freezes of the 25th, after which they deteriorated.

TEMPERATURE.

The average temperature for the State, determined from reports of 41 stations, was 46.8°. Temperatures much above the seasonal average, with maxima between 70° and 80°, prevailed during the period 14-18th. Marked departures below normal occurred on the 25th and 26th. There were no special extremes at other times, but moderately low temperatures were most frequent. Extremes for the State were 78° at several stations on the 17th and 18th, and 10° at Eubank and Greensburg on the 26th.

PRECIPITATION.

Reports from 81 stations, gave a precipitation average for the State of 3.93 inches, which is 0.40 inch above normal. In a group of southeastern counties from 5.0 to 7.5 inches occurred, surrounding this area in a considerable district that extended northward over the southern bluegrass region amounts ranged from 4.0 to 5.0 inches. There was an area of like precipitation in the lower Cumberland and Tennessee valleys, and eastward for a few counties. In the southwestern counties near the border less than 3.0 inches occurred, and also in the lower Kentucky River Valley and westward along the Ohio. In other districts amounts ranged between 3.0 and 4.0 inches. Moderate snowfall occurred generally from the 2d to 4th and locally from the 8th to 11th. There were heavy local rains in the periods 6th to 9th and 28-30th. Precipitation ranged between 2.55 inches at Lockport, Henry County, and 7.51 inches at Midelburo. There were snow flurries in the northern and eastern districts. No thunderstorms were reported.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are included in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days.

[a] Also on other dates. [b] Received too late to be included in means and summaries. [c] Precipitation is less than 0.01 inch rain or melted snow. [d] Locks 4, Nicholasville Ky.; Lock 5, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

† Also on one or more earlier dates. ‡ Received too late to be included in means and summaries. §Lone Oak.

* Past office addresses.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Middlesboro, and along many streams; and much property in bottoms was washed away. Mining interests suffered heavily. Reliable estimates could not be obtained but the damage undoubtedly exceeded $500,000, $80,000 of which was on the South Fork of the Kentucky. These freshets caused moderately high stages in the Beattyville district. Other streams were not especially affected.

MISCELLANEOUS.

[illegible] Excessive rains caused floods in headwater streams in the basin of the [illegible] 14 to 16 inches fell over the South Fork of the Kentucky River, affecting the counties of [illegible] Clay, Knox, Bell and Harlan. Three men were drowned when a bridge was [illegible] Basements and lower floors were flooded in Pineville, [illegible]

Daily Precipitation for November, 1928.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

¶ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.005 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

†Long Oak.

Daily Temperatures for November, 1928.

VOL. XXXIII LOUISVILLE, KY., DECEMBER, 1928 NO. 12

GENERAL SUMMARY.

Except for two relatively short periods of subnormal temperature, one early in the month and the other in the third decade, moderate conditions prevailed. The early cold spell checked the growth of winter grains, leaving the plants quite small but generally vigorous. The mild weather of the second and third decades caused some growth, but as the month progressed the freezing at night gradually brought about a dormant condition. The comparatively high day temperature, augmented by the abnormally large amount of sunshine, caused general thaws; while the night freezes, occasionally rather deep, were inclined to produce some lifting of the plants. On heavy soils which retained their water content, the deeper freezes caused some heaving, but the injury was not extensive. There was no snow cover of consequence. Relatively light precipitation, less than half the normal amount at many stations, was favorable for grains, feeding, outdoor occupations, and the improvement of dirt roads. Because of the equable character of the weather, with its dryness and sunshine, stock fared exceedingly well and milk production was maintained better than usual. In the first half of the month tobacco with moist atmosphere were sufficiently numerous to permit of almost continuous handling of tobacco, but there was some delay in the last half due to the continued dry weather. The other weather elements, especially the mild temperature, were favorable, therefore progress in stripping and disposing of the crop was reasonably good. Some corn remained out at the beginning of the month could be readily gathered on many days. The mornings with hard frozen soil were favorable for removal of corn and fodder from the fields. Pastures were used in dry districts in the mild weather, but complete feeding was necessary during a large part of the month.

TEMPERATURE.

As determined from the records of 42 stations, the average temperature for the State was 39.5°, which is 1.9° above the December normal. Unseasonably high temperatures, with maxima reaching 70° at some stations, prevailed in the period 12-16th and 25-29th. The lowest temperatures were generally registered in the short cold spell from the 5th to 9th. Extremes for the State were 72° at Owensboro on the 27th and 5° at Farmers on the 22d.

PRECIPITATION.

The average precipitation, as shown by the reports of 81 stations, was 2.52 inches, which is 1.76 inches less than the monthly normal. A belt of moderate rainfall, in which amounts ranged between 3.0 and 4.0 inches, extended from the Purchase to the Lower Kentucky River. South and east from this district precipitation decreased irregularly to about 1.0 inch in the southern bluegrass region and 1.5 inches in the upper Cumberland valley. It was only slightly heavier eastward in the mountain region. Heavy rains occurred more or less generally in the central and western districts on the 17th, otherwise precipitation was light to moderate and rather local for a winter month. It was fairly general in the period 4-5th, 17th, and 27th, and snow fell scattered on the 12-13th and 28th-31st. Precipitation varied between 0.79 inch at Whitesburg and 5.15 inches at the Owensboro Green River station. Snowfall ranged between a trace and 2 inch. No thunderstorms were reported.

MISCELLANEOUS.

Rivers.—Stages in the Ohio and its tributaries were moderate to low during the month. Except for short periods, it was necessary to operate the dams in the Ohio.

VOL. XXXIII LOUISVILLE, KY., ANNUAL, 1928 No. 13

GENERAL SUMMARY.

Although the mean temperature and total precipitation for the year were near normal, departures from the average conditions in some months approached past extremes. June was the hottest and next to the coolest month of the name on record. The last half of September was also very cool, with the earliest killing frost of record in most of the State. With the exception of February all months in the first half of the year were unusually cool. Except September, the other six months were relatively warm. Thus, while the spring and early summer were unfavorable for starting the crops, temperatures later on were generally favorable for bringing them to maturity. Precipitation in January, February, and March was deficient but frequent. Light snowfall and variable temperature, resulting in many deep freezes and complete thaws, brought extensive injury to winter wheat. A considerable proportion of the crop was frozen out and had to be abandoned. The spring freezes caused much damage to fruit, which had blossomed in the warm weather of late March and early April. The first half of May was favorable for plowing and seeding, but low temperatures retarded germination and growth. Precipitation of extraordinary frequency and amount in June established a new record for the month, and almost equaled the record precipitation of January, 1913. These rains prevented cultivation and caused enormous damage to soil and crops by washing and flooding. Excessive coldiness and standing water caused the abandonment of much corn on level or bottom lands. Drought beginning in July in the western counties and spreading to the eastern section in September, prevented preparation of soil for seeding. These conditions caused much seeding to be delayed until the rains came in October, and prevented germination of grain sown at the proper time. Most wheat came up too late to stool freely or set deeply, and entered the winter insufficiently resistant. Except for this feature the fall weather was highly favorable, allowing the curing of corn in shock and tobacco in barns, with consequent improvement in condition. As a result corn gathering and tobacco stripping were advanced. The premature killing frost in September did not injure early crops, which the favorable weather had brought to maturity; but it practically ruined late potatoes, and damaged some late tobacco, corn and potatoes. The rains that began late in October caused partial recovery of pastures, with most improvement in the eastern counties. Meadows, alfalfa, and clover revived sufficiently to cover the winter with fairly strong growth. Relatively dry weather and moderate temperature in the early winter favored seeding and general outdoor work.

The Weather by Months.

JANUARY. — A cold wave at the beginning was followed by two weeks of mild weather, and this in turn by another cold period. Grasses and late sown wheat suffered severely from heaving freezes.

FEBRUARY. — Although temperatures above normal predominated, frequent freezes kept vegetation dormant. Freezing and thawing, without snow cover, caused further injury to wheat and grasses. Light precipitation permitted some plowing.

MARCH. Variable temperature resulted in additional damage to winter grains in the first half. Dry soil and favorable temperature in the last half resulted in rapid progress with plowing, and gardening. Tobacco plantbeds were sown in good time. Spring work was ahead of the season.

APRIL. - There was much planting in the warm spell at the beginning, but subnormal temperatures until near the end interfered with germination and retarded growth. Fairly heavy precipitation was generally beneficial.

MAY. — Prevailing low temperature affected germination and delayed the progress of crops. Dry weather in the first half was unfavorable but the rains in the last half accelerated growth. Only cool weather vegetables made satisfactory progress.

JUNE. — The excessive and almost continuous rains rendered this an outstanding month for damage to crops and prevention of tillage. On well drained uplands growth was fairly good, but crops on flat or bottom lands frequently deteriorated. Ripening of wheat was delayed and hay harvest of any kind was practically impossible.

JULY. — Rains in the first two weeks interfered with cultivation, but later in the month the soil dried hard and corn suffered for moisture. In general the sunshine and dry weather improved all crops.

AUGUST. Temperatures above normal were favorable, and rainfall was sufficient in the central and eastern districts. Dry weather adversely affected crops and pastures in the western counties. Weather conditions were favorable for cutting and housing tobacco, which began about the middle of the month.

SEPTEMBER.---In most districts the month was almost rainless until near the end. Drought in western counties injured corn

a Temperature determined from seven-day registering thermometers.
b Also on other dates.
c Average, 5, 6, 7, 8, 9, 10, 11 o'clock a. m. and p. m. of the 15th of each month.
d Average of 7 a. m., 2 p. m. and 9 p. m. observations.
e Record incomplete.
f Average for the month of the last 5 years.
g Average for the month of the last 10 years.
h Average for the month of the last 15 years.
i Average for the month of the last 20 years.
k Average for the month of the last 25 years.
l Average for the month of the last 30 years.
m Average for the month of the last 35 years.
n Average for the month of the last 40 years.
o Average for the month of the last 45 years.
p Average for the month of the last 50 years.
q Average for the month of the last 55 years.
r Average for the month of the last 60 years.
s Average for the month of the last 65 years.
t Average for the month of the last 70 years.
u Average for the month of the last 75 years.
v Average for the month of the last 80 years.
w Average for the month of the last 85 years.
x Average for the month of the last 90 years.
y Average for the month of the last 95 years.
z Average for the month of the last 100 years.

* Also on other dates.

Note.—Figures in the first column after the name of a station indicate the number of years record of temperature; figures in the second column after the name of a station indicate the number of years record of precipitation; figures in the third column after the name of a station indicate the number of years record of snowfall. The dash (—) indicates that the record is incomplete and no average has been computed. The letter T indicates a trace of precipitation.

January was unfavorable to the early crops.

February was favorable to the early crops.

March was favorable to the early crops.

April was favorable to the early crops.

May was favorable to the early crops.

June was favorable to the early crops.

July was favorable to the early crops.

August was favorable to the early crops.

September was favorable to the early crops.

October was favorable to the early crops.

November was favorable to the early crops.

December was favorable to the early crops.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all records are used in computing the means for the various state, section or division means.

† Records of these stations are incomplete and not used in computing section or division means.

‡ Rotoway, Brawner Elk and Woolsey are Locks on the canal; for other Locks see Locks and Dams.

Williamsburg																										

All temperature data are taken from self registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining the State or division means.

Reference letters, as, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., JANUARY, 1929 No. 1

GENERAL SUMMARY.

Although the month averaged colder than normal, temperatures were characterized by marked variability and decided extremes. There were two short periods in the first half when temperatures fell to zero or lower at many northern stations. The last of these was followed by a sharp rise in temperature near the record highest on the 18th, which ushered in a week of unseasonably warm weather, with severe windstorms in most districts. The month closed with another decidedly cold period of several days in which temperatures near zero were again registered at many stations. These sharp changes, with the attending thaws and freezes, were unfavorable for winter grains. Some heaving, with moderate injury, occurred on the heavy and slow draining soils, where late wheat seems to have suffered considerable damage. Apparently, however, injury was not as extensive as the character of the weather would indicate, due to the fairly good drainage of the surface layers of the soil immediately preceding the severe freezes, which lessened the lifting effect, and also to the rather long periods during which the soil remained frozen without change. Wheat and rye made some growth in the warm week. At the time of lowest temperature on the 13th and 14th, there was some light snow cover in the northern counties. Snowfall was light and largely melted as it fell. Precipitation was near normal in amount, but its frequent occurrence hindered outdoor work and kept the fields so wet that they could be entered with difficulty. This frequency, with the resulting high humidity, favored the handling of tobacco. The crop was moved to market quite rapidly, despite the bad condition of the dirt roads. The low temperature at times necessitated special care of livestock, but in general the weather was more favorable than usual in this mid-winter month.

TEMPERATURE.

An average of the records of 42 stations gave a State mean temperature of 34.8°, which is slightly below normal. Changeable conditions prevailed during the first decade, after which the periods with temperature of the same character were quite lengthy. Maxima above 70° were registered at many stations on the 18th, and 69° to 76° on the 22d. Minima below zero occurred at several northeastern stations on the 15th. Extremes for the State were 76 on the 18th at Mayfield and 19th at Ashland, and 6 at Scott on the 14th.

PRECIPITATION.

The records of 82 stations show a precipitation average for the State of 4.54 inches, which is slightly above normal. Moderate to heavy rains occurred on the 1st, 10th, 19th, and 24-25th, otherwise daily amounts were generally light. There were but few days on which measurable precipitation was not reported from some station. Snow occurred frequently but amounts were light and soon melted. It ranged from flurries in the southern and western counties to 5.0 inches in the extreme northeastern districts. Areal distribution of precipitation was quite irregular. Amounts greater than 5.0 inches occurred in areas limited to a few counties in the lower Ohio Valley, the Green River Valley, the upper basin of the Kentucky, and the western bluegrass region. In most other districts amounts ranged between 3.0 and 4.5 inches, decreasing irregularly toward the eastern counties. Precipitation varied between 2.16 inches at Willow, Lee County, and 7.20 inches at Lone Oak near Paducah. Thunderstorms were reported on the 5th, 18th, and 24th.

[a] Temperature data are taken from self-registering thermometers.

[b] Highest and lowest temperature and precipitation are summated only for such stations as have ten or more years of record, but all complete reports are included in the general means and totals. [c] Monterey, Brownsville and Woodbury are Locks in the Green River; other Locks are on the Kentucky River.

[d] Approximate, portion of division record.

[e] Interpolation or division records.

[f] Dashes in the table indicate absence of days missing; for example, 8 represents two days, etc.

[g] Less than 2 years. [h] Approximate. [i] Precipitation is less than 0.01 inch, rain or melted snow. [j] Long Oak

[k] Post office address: Lock 5, Lawrenceburg, Ky.; Lock 7, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky

[l] Received too late to be included in means and summaries.

[m] Post office address: Lock 9, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky

MISCELLANEOUS.

Aug. 1: A severe windstorm caused widespread damage in those parts but ill... [illegible] ... has and Fleming counties. The total loss was roughly estimated at $1,250,000, of which probably $800,000 occurred in the counties of Fayette, Clark, Madison, Bourbon, Nicholas, and Jessamine. At Sumner, Hardin County, the path of destruction was about one half mile wide and 9 miles long, extending from southwest to northeast. A path of

Daily Precipitation for January, 1929.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark **) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

Precipitation inapparent in the morning's amount then recorded is for the preceding 24 hours. §Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi. *Incomplete.

‡ The same width and direction was devastated across Nicholas County. In these houses and to utility systems.

orts of evidence of tornadic activity were noted. Five persons were killed, one at *Berry*. A moderate rise occurred in the streams of the State, including the Ohio, ople, one in Scott, two in Taylor, and one in Hardin County. One person was following the longest gales of the 30th. Flood stage was exceeded by a few feet at ed in Jefferson, one in Green, and one in Fayette County. Most of the damage Evansville and was nearly reached at other points between Owensboro and Paducah. o barns, hundreds of which were destroyed, to the roofs of residences and business.

Errata for December, 1928.—Pendleton precipitation, total 1.62.

Daily Temperatures for January, 1929.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., FEBRUARY, 1929 No. 2

GENERAL SUMMARY.

The month was abnormally cold and decidedly unfavorable for all outdoor activities. Short periods of thawing and freezing in the first decade and near the middle of the month resulted in some lifting of winter grains, but apparently there was no serious injury. The late sown wheat was mostly affected by these conditions. The complete thaw near the end of the month was followed by better soil drainage and some growth, especially in the southern and western counties. There was light snow over for a few days in the first, second, and last weeks. The snow of the 21st was exceptionally heavy in the southern and eastern districts, but went off rapidly under the influence of the rising temperature and rain. Although precipitation averaged below normal, the soil continued very wet, with its deeply frozen condition preventing drainage, and surface thawing causing the water to stand in places. Plowing was not feasible, even in the most favorable localities and soils. No progress could be made with any kind of late winter or spring work. The persistent low temperatures necessitated special care and heavy feeding of livestock. The loss of spring lambs was larger than usual on account of the inclemency of the weather, which also unfavorably affected milk and egg production. The sharp rise in temperature in the last week, accompanied by heavy rains, especially in the district covered by snow, caused floods in most streams of the State, with overflowing of lowlands. The cold, dry winds were unfavorable for handling tobacco, and the bad condition of the dirt roads impeded movement to market. Improved roads, softened by the deep freezes, were seriously damaged in places by heavy hauling.

TEMPERATURE.

The average temperature for the State, based on the records of 42 stations, was 31.2°, which is 5.4° below normal, and among the low records for this month. Except for a few moderately warm days, temperatures averaged almost continuously below normal, with departures ranging from 5° to 25° on most days. Radiation over the heavy snow cover in the mountains and northeastern counties resulted in temperatures below zero on the last week. Extremes for the State were 68° at Murray and Mayfield on the 26th and -14° at Farmers on the 23d.

PRECIPITATION.

The average precipitation for the State, as deduced from the reports of 82 stations, was 3.58 inches, which is slightly above normal. Showers and light snow occurred in the period 4-9th, and light to moderate rain and heavy snow from the 19th to 21st. The snowfall on the 21st in the southern and eastern counties ranged from 10 to 20 inches, with the greatest depth in the upper basins of the Kentucky and Cumberland rivers. Moderate to heavy rains occurred on the 25th and 26th. The snow had largely melted before these rains, but enough remained over the area of heaviest accumulation to greatly increase the run-off and cause headwater floods. Precipitation was heaviest in the southern counties, where it ranged from 4.9 to 6.0 inches. It decreased irregularly northward to about half of these amounts along the Ohio River. Total snowfall ranged from 5.0 to 10.0 inches in northwest districts and from 12 to 20 inches in the southern and eastern counties. Precipitation varied between 1.55 inches at Scott and 6.30 inches at Marion. Thunderstorms were reported on the 25th and 26th.

MISCELLANEOUS.

February 25.—A windstorm on the boundary between Trigg and Christian counties damaged or destroyed dwellings and outbuildings.

State averages and extremes		..	..	31.2	− 5.4	68	26	−14	23	57	..	..	..	..	..	..	..	..	..	

All temperature data are taken from self-registering thermometers.

All precipitation data are taken from automatic instruments and totals are computed only for such stations as have ten or more years of record; but all complete reports are published regardless of length of record. Dashes (-) indicate missing data. Trace, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and its navigable tributaries. Dams are on the Ohio River.

Dates of occurrence and number of days are given for the extreme values, and to date maximum monthly precipitation is the number of days measured; for example, 5 represents two days, etc.

Dates followed by † are preceding to the table indicate number of days missing; for example, 5 represents two days, etc.

Reference letters, a, b, c, appearing in the table indicate that data are to be included in means and summaries. T, Precipitation is less than 0.01 inch rain or melted snow. tr, Trace. Oak.

a Also on other dates. b Enlarged for date to be included in means and summaries. c Precipitation is less than 0.01 inch rain or melted snow.

* Destroyed addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 7, Lockport, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Reed House, Ky.; Scott, Independence, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

* Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. † Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

*Lone Oak

Daily Temperatures for February, 1929.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., MARCH, 1929 No. 3

GENERAL SUMMARY.

The first decade was generally cold, windy, and disagreeable, with some freezing and thawing unfavorable to winter grains. After the 10th, decidedly warm weather predominated and conditions favorable for outdoor work prevailed. The relatively light precipitation permitted good soil drainage early in the month, at which time sod plowing began on hillsides and uplands. Plowing was extended to fallow land with marked progress. The favorable weather caused farm and garden activities to be pushed to a degree not often possible in this month. Moderate rains stopped this work at times for brief periods, but satisfactory progress continued in the upland districts. Sowing of tobacco plantbeds commenced during the mild weather of the second decade, and proceeded to completion with little interruption from unfavorable weather. Oats were sown late in the month, potatoes were extensively planted, and early gardens received attention. Because of the deep freezes and generally moderate precipitation of the winter preceding, the soil worked exceptionally well. Under the stimulating influence of the high temperature, seeds of early vegetables germinated, shrubs and fruit trees burst into bloom; while grains, grass, clover, and alfalfa started quickly into rapid growth as if forced in a hotbed. Peaches, plums, and pears were in full bloom in the last week, even in the northern districts. Although wheat on wet or heavy soils showed evidence of winter killing in spots, on the better drained soils the crop exhibited a good stand of vigorous plants with little or no indication of winter injury. Tillering commenced late in the month. Bluegrass pastures on warm slopes reached the grazing stage in the last week. Vegetation in general was about two weeks ahead of the season, and spring work was almost equally advanced.

TEMPERATURE.

The records of 42 temperature stations gave an average for the State of 52.0°, which is 5.7° above normal. The periods 12-15th, 22d-25th, and the 31st were remarkably warm, with mean temperatures 10° to 30° above normal and maxima of 90° to 99°. The highest for the State, 94° at Hopkinsville on the 24th, is a record for this month. In the short cold period, 7-10th, minima of 10° to 15° occurred at most eastern stations, with the lowest, 9° at Farmers and Scott on the 10th.

PRECIPITATION.

Precipitation for the State, as shown by the reports from 42 stations, averaged 4.17 inches, which is slightly less than normal. It increased with some regularity from 2.5 inches along the middle Ohio River to 4-5 inches in the district extending from the Big Barren to the lower Big Sandy. Between the southern Bluegrass and the Tennessee and Virginia borders, precipitation ranged from 6.0 to 10.0 inches, with the heaviest in the upper Cumberland Valley. The snowfall was 2.0 to 5.0 inches in the Bluegrass and northeastward, but very light southward. Moderate to heavy rains occurred in the period 6th, 13-14th, and 29-30th. The rainfall was excessive on the 5d in the southeastern counties. There was measurable precipitation on nearly every day from the 13th to 31st. Monthly amounts varied between 1.91 inches at St. John and 10.20 inches at Middlesboro. Thunderstorms were reported on the 7th, 11th, 19th, 25th, 28th, and 31st.

MISCELLANEOUS.

March 15.—A farmer was killed by lightning near Delaney, while in the open.
March 31.—A windstorm caused damage of about [illegible] to a brick [illegible] at Ashland, and further losses estimated at $2,000, mostly to barns and outbuildings, in Boyd County.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., APRIL, 1929 No. 4

GENERAL SUMMARY.

The spell of warm weather that began early in the preceding month lasted through the first decade, making in all a period of thirty days in which temperatures averaged about 10° above normal. Vegetation continued its rapid advance, and spring work was pushed accordingly. In the second and third decades variable temperature prevailed, with the average somewhat below normal. Frequent decidedly cool days, with occasional light to heavy frosts, retarded growth sufficiently to bring about more seasonal conditions of vegetation by the end of the month. This slowing of growth was rather favorable for wheat, which had reached the jointing stage in the third week and was too far advanced for safety from late freezes. Although a larger proportion of tillable land had been prepared than usual, the cooler weather resulted in a tendency to defer the planting of corn and vegetables requiring warmth until conditions were more favorable for germination. Therefore, there was less planting of corn and cotton than weather conditions early in the month indicated as probable. Most of the corn planting occurred in the southwestern counties, where higher temperatures and lighter precipitation justified advancing the work. Plowing and soil preparation had reached such an advanced stage in the long period of highly favorable weather that ended with the first decade, that the frequent showers later did not seriously interfere, and this phase of farm activity remained ahead of the season throughout the month. Precipitation averaged near normal and was fairly well distributed through the month. Potatoes, oats, bluegrass, clover, and alfalfa made satisfactory progress. Gardens were adversely affected by the cool weather, especially vegetables requiring steady warmth. Fruit was damaged locally in some eastern localities by freezing temperatures on the 19th and 22d; but its average condition was better than usual. Showers during apple blossoming interfered with setting of fruit.

TEMPERATURE.

Reports from 42 temperature stations gave an average for the State of 60.1°, which exceeds the normal for the month by 3.9°. Most of this excess accumulated in the period of extraordinary warmth from the 3d to 9th, when daily temperatures averaged from 10° to 27° above normal. High minima resulted in exceptionally warm nights. Extremes for the State were 96° on the 6th at Ashland, Quicksand, and Williamsburg; and 23° on the 9th at Farmers.

PRECIPITATION.

The precipitation average for the State, as determined from the reports of 82 stations, was 3.57 inches, which is somewhat less than normal. In an irregular east-west belt across the center of the State, broadening to include most of the mountain district, amounts ranged between 2.0 and 3.5 inches. In the Northern counties, and in most of the south half of the State, from 4.0 to 5.0 inches occurred. There were light to moderate showers on the 1st, 20th-22d, and 25-26th. Moderate to heavy rains occurred quite generally in the periods 8-11th, 14-15th, and 28th. Monthly amounts varied between 1.63 inches at Whitesburg and 5.55 inches at Franklin. Thunderstorms were reported on the 1st, 3d, 4th, 6th, 10th, 11th, 20th, 21st, 25th, 27th, 28th, and 30th. Hail was remarkably general and frequently heavy on the 21st. It was heavy in some northern counties on the 25th.

MISCELLANEOUS.

A dash indicates data are taken from self-registering thermometers.

Averages and departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. Temperat

Daily Precipitation for April, 1929.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark [***]) Regular Weather Bureau stations; precipitation is for the 24-hour period, midnight to midnight.

Precipitation column "a" is the morning amount that is recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi. * Long Oak.

April 25.—Heavy hail, causing some damage to fruit, occurred in Oldham, Boone, Kenton counties.

Rivers.—The Ohio was above flood stage at Paducah from the 1st to 6th and at Cairo from the 1st to 21st and again on the 30th. Backwater from the Ohio affected the lower courses of the Green, Cumberland, and Tennessee. Considerable freshets occurred in the upper Cumberland and Big Sandy on the 29th.

Errata for March 1929.—Snow, total precipitation should be 2.57; prevailing wind direction SW.

Daily Temperatures for April, 1929.

VOL. XXXIV LOUISVILLE, KY., MAY, 1929 No. 5

GENERAL SUMMARY.

Prevailing low temperature, with frequent and often excessive ains, rendered the first three weeks decidedly unfavorable for utdoor work and retarded the growth of crops requiring season- l warmth. Dry periods in this part of the month were too ort to permit much plowing, hence preparation of land re- aining unplowed was largely delayed until the last decade, hen weather conditiods improved and better progress was ossible. Corn planting proceeded slowly in the brief intervals etween the rainy spells, and was still unfinished in the north- n and western counties at the close. The long periods of un- asonably low temperature affected the germination of early rn, the extent of injury being greatest where the soils were eavy and the drainage relatively poor. Much bottom land in e western counties remained flooded or partly covered with anding water until late in the month, preventing all activities such districts. Subsidence of streams and fair weather in e last decade enabled farmers to begin breaking and planting ese lands. Temperatures above normal in the last week mulated germination with the result that stands of late corn re generally good. The showery conditions favored tobacco tting by hand which progressed rapidly. Weather permitting achine transplanting prevailed in the last week. Except for few hot days near the end, the weather was favorable for ob- ning a stand. The persistent low temperature and dampness, th general lack of sunshine, seriously damaged strawberries, using much loss in the fields and poor condition on market. e drier weather of the last decade greatly improved the con- ion of the later berries. Potatoes fared better than other ops, but suffered from lack of cultivation. Except where af- ted by standing water or defective drainage, wheat made od progress. Forage crops and pastures grew luxuriantly, h a tendency to rankness. Harvesting the first crop of alfalfa s delayed because of weather unfit for curing.

TEMPERATURE.

The record of 42 stations gave a State temperature average of 1°, which is 1.2° below normal. Daily deficiencies in the t decade and the third week ranged from 5° to 15°, with nima at some eastern stations only a few degrees above freez- . Departures as large in excess of normal occurred in the week, with maxima above 90° on the last three days. Ex- mes for the State were 98° on the 29th at Quicksand and 32° the 3d at Maysville.

PRECIPITATION.

The precipitation average for the State as determined from orts of 81 stations, was 7.35 inches, which has been exceeded y in this month by the record May rainfall in 1927. In arrow belt from two to four counties in width, extending n the lower Cumberland to the lower Licking, amounts ged between 8.0 and 10.0 inches. East of this district and a limited area to the westward from 5.0 to 8.0 inches rred. The western and southern parts of the Purchase re- ed from 8.0 to 9.0 inches. Moderate to heavy rains occurred y in the first week. They were excessive in many localities he 2d, 3d, 6th, and 7th. Rain was also moderate to heavy period 12-15th, and heavy to excessive on the 18th and 19th. Local showers, were occasionally heavy, occurred from the 25th to 30th. Monthly amounts d from 4.56 inches at Monticello to 11.21 inches at Cherokee Park, Louisville. erstorms were reported on 16 days, with considerable damage from lightning ind.

MISCELLANEOUS.

May 2.—Wind, rain, hail, and lightning caused damage estimated at $15,000 in Hen- derson and Webster counties. Hail penetrated roofs, broke tops, and gashed fruit trees. Damage of $10,000 was attributed to hail. A boy riding a horse and leading two others was killed by lightning, together with the horses, in this storm. At Henr-

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Referenced letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow.

[1] Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

[2] Lone Oak.

[3] Greenup, Dam 30 and Oneonta, Dam 35 are Locks on the Ohio River; other Locks are on the Kentucky River.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning: amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi. ¶ Long Oak.

May 13.—A windstorm with tornadic characteristics occurred in Bracken County. path was about seven miles long and quite narrow. A residence and several s were destroyed with a loss of about $10,000.

y 26.—An excessive rain of 3.63 in two hours caused extensive flooding o: resi- es and business houses at Hopkinsville, with heavy loss.

River.—The Mississippi was above flood stage along the western border during the entire month. The Ohio was moderately high practically all of the month. Its lower course was above flood stage at places in the Evansville-Cairo section after the 8th. Green River stood above flood stage at Woodbury from the 8th to 10th and at Rumsey from the 9th to 15th.

Errata for April 1929.—Eubank lowest temperature on 2d.

Daily Temperatures for May, 1929.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

THE LIBRARY OF THE
UNIVERSITY OF ILLINOIS

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., JUNE, 1929 No. 6

GENERAL SUMMARY.

Low temperature that predominated, during the first half adversely affected the growth of early corn and cotton, and delayed the germination of later plantings. In the last half, however, temperatures near or above normal stimulated growth and favored cultivation, thus largely offsetting the earlier retarding influences. Heavy to excessive rains in the second and third weeks caused some damage by local flooding and washing, and spot lowlands generally too wet for preparation or planting. With the exception of such lands, corn planting was practically completed in the first week. As a rule the dry periods were long enough to permit of thorough cultivation of early corn and tobacco. Although somewhat foul at the inception of this work, the timely recurrence of short dry spells resulted in a rapid and fairly complete cleaning of these crops. Showers at intervals in the first half favored completion of hand transplanting of tobacco, while the low temperature helped to insure good stand. There was also ample opportunity for machine setting, since no delay from weather conditions occurred in putting out the tobacco crop. The higher temperature and drier weather of the last two weeks hastened the ripening of wheat and provided suitable conditions for harvest, which began in the southern counties about the 15th and moved north and east during the remainder of the month. Much first crop alfalfa was cut at its time, because of weather previously unfit for curing. This period provided the first weather favorable for the growth of cotton. Temperature and moisture conditions of the first half favored oats, which developed better than usual. Pastures continued excellent throughout the month, although their rank luxuriance was checked by the higher temperature and drier weather of the last half. These conditions were opportune for the saving of bluegrass seed. The month ended with marked improvement visible in all crops, and farm activities as affected by the weather in a highly satisfactory state.

TEMPERATURE.

Reports from 42 temperature stations gave an average for the state of 71.7°, which is 2.1° below the normal for this month. Mean daily deficiencies of 5° to 18° predominated in the first two weeks. Minima of 37° to 45° occurred at most stations on the 3d and 4th. Light frost was reported from some northern localities on the 3d. There were a few rather warm days in the third week, but as a rule maxima were lower than usual in this month. Extremes for the State were 97° at Bowling Green on the 20th and 37° at farmers on the 4th.

PRECIPITATION.

As determined from the records of 83 stations, the State average precipitation was 4.11 inches, which is near normal for June. It occurred almost entirely in connection with thunderstorms, hence was local and irregular in distribution. In a few northeastern border counties the total rainfall ranged from 5.0 to 7.0 inches. It also exceeded 5.0 inches in limited areas from Mason county southward across the Licking Valley, at the mouth of the Kentucky, and in the extreme western counties. In the central district, including the Green River Valley, and also in the extreme eastern counties amounts ranged from 2.0 to 4.0 inches. Moderate to heavy rains occurred generally in the periods 9th, 12-14th, and 24th-26th. Showers, more or less local in character, occurred on the 23d and 19th-21st. The rains of the 13-14th were heavy to excessive in many localities, and a few places received similar rains on the 25th. Monthly amounts ranged between 1.56 inches at Irvington and 6.59 inches at Hopkinsville. Thunderstorms were reported on 16 days, frequently attended by destructive lightning.

				71.7	− 2.1	97	30	37	4	40										

Many averages and totals omitted.

All temperature data are taken from self-registering thermometers.

The departures from normal temperatures and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. † Received too late to be included in means and summaries.

¶ Post-office addresses: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

§ Locke Oak.

T Precipitation is less than 0.01 inch rain or melted snow.

MISCELLANEOUS.

June 12. — A windstorm damaged roofs in Christian County to the extent of several thousand dollars. A tornado in Muhlenberg County destroyed a barn near Winchester. Two boys were drowned when bathing in the Kentucky River at Frankfort.

June 13. — Damage to truck gardens estimated at $10,000 was caused by heavy hail in Jefferson County and the southern edge of Louisville. Wind caused some damage to roofs and trees in the same district. Damage of about $10,000 to roofs and timber was reported from Grayson County.

Daily Precipitation for June, 1929.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak.

ne 16.—Lightning destroyed a barn near Inderendence with a loss of about $700.

ne 18.—Lightning touched an apartment in Louisville causing damage near $0.

ne 24.—Lightning destroyed a barn near Richmond with a loss estimated at .

Rivers:—In the Ohio stages declined steadily, reaching pool levels in the last week.

Errata for May 1929.—Paducah (near) total precipitation 9.74 inches. Departure from normal +5.57 inches.

Mean precipitation for State 7.37 inches; departure +3.37.

Daily Temperatures for June, 1929.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., JULY, 1929 No. 7

GENERAL SUMMARY.

Temperatures were variable, ranging from slightly above to considerably below normal in short periods, but they exhibited no marked extremes. Rather high temperature in the last week had a tendency to intensify local drought conditions, otherwise this weather element was decidedly favorable for all crops and farm activities. Heavy rains in the northeastern counties in the first two weeks interfered with hay harvest and threshing, caused some damage to grain in shock, and delayed cultivation of late corn and tobacco. Weediness increased in corn that had been laid by. The dry weather of the last two weeks permitted advancement of all activities in that district as well as other parts of the State. In the west-central counties the dry weather began early in the month, so that some localities received only light scattered showers in a period ranging from three to four weeks. By the middle of the month soil moisture showed depletion in such dry districts, after which evidence of drought injury soon became apparent in the firing of early corn and retardation of the growth of tobacco. The effect of the drought was most serious in corn that reached the tasseling stage. The month closed with this part of the crop in a critical condition on hillsides and uplands in more than half of the western division, with evidences of extension of drought eastward through the central counties. Oats harvest, also the cutting of clover, timothy and delayed alfalfa proceeded during the dry spell under highly favorable conditions for curing. In the eastern counties precipitation was fairly heavy and sufficient in most districts, resulting in satisfactory progress of the staple crops. Early tobacco advanced to the topping stage. There was much complaint of rust on tobacco in this region during the wet weather of the first two weeks, but the dry weather of the last half checked the disease. Drought delayed the growth of late tobacco in the central and western counties and made cultivation difficult. Pastures remained good in the eastern counties but deteriorated from lack of moisture toward the end in many western districts. Gardens, truck, and field tomatoes also began to suffer in such localities. It was too dry for late potatoes in most central and western sections.

TEMPERATURE.

The records of 41 stations gave an average for the State of 73.7°, which is practically normal. Except for a few rather cool days in the first and third weeks, no special variations from normal temperatures occurred. The frequency of maxima of 90° or higher was less than usual in this month. Extremes for the State were 101° at Hopkinsville on the 28th, and 46° at Farmers on the 3d.

PRECIPITATION.

The average of the rainfall reports from 82 stations was 3.97 inches, which is slightly less than normal. Moderate to heavy rains occurred in the central and eastern counties on the 1st-2d. Local showers, mostly light, occurred daily in the period 5-10th, after which only scattered showers were reported from the central and western counties. In the eastern districts light to moderate showers were fairly general on the 19th and local showers from the 26th to 31st. Areal distribution was decidedly irregular, but the eastern half of the State received considerably more rain than the western. In limited districts immediately west of the lower Kentucky, in the northern counties and in the southeast mountain counties amounts ranged from 5.0 to 7.0 inches, 1.6 to 3.5 inches occurred in most of the western half of the State. The driest area was the district between the Green and Ohio, where 2nd-15th were generally less than 1 to 2.0 inches. For the State precipitation ranged between 0.95 inch at Dana No. 1 and

All temperatures here are taken from standard thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

† Also on other dates. †† Received too late to be included in means and summaries. ‡ Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

¶ Post-office addresses:—Lock 6, Lawrenceburg, Ky.; Lock 8, Versailles, Ky.; Lock 4, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

near Owensboro and 9.86 inches at Farmers. Thunderstorms occurred almost daily from the 1st to 14th, and also on the 18th, 25th, 26th, 29th and 31st.

MISCELLANEOUS.

July 9.—A heavy rain flooded basements and lightning caused minor damage at Lexington. Wind blew down trees and damaged crops in Fayette County.

July 19.—Near Lexington lightning burned a barn and shocked into unconsciousness a girl sitting at a window of the farm residence about 75 yards away.

Rivers.—Rains in the upper basin kept the Ohio at moderate stages until about the middle of the month, after which it declined to pool stages. The other rivers of the state were generally low.

Daily Precipitation for July, 1929.

Except as otherwise indicated observations are for daily period ending in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Record incomplete. Weather Bureau station precipitation is for the calendar month, midnight to midnight.

( ) Precipitation measured on the morning observation included in the preceding month.

Dates in separate dates of falls not recorded. T. Trace, or less than 0.01 inch. ... Precipitation included in the next following measurement.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (M) Mississippi; (O) Ohio.

¶ Lone Oak.

Daily Temperatures for July, 1929.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., AUGUST, 1929 No. 8

GENERAL SUMMARY.

Temperature averaging below normal, with many cool nights in the last two weeks, was rather favorable for crops in the dry areas but retarded their growth where sufficient moisture had been received. The rainfall occurred as local showers, with marked irregularity in distribution and a large deficiency in most sections. The heavy rains of the first week in the western counties relieved the drought and, with the moderate showers later in the month, assured fairly good crops. In the second week the rains extended eastward over the southern counties, greatly improving crop conditions in that section. Moderate showers in the northeastern counties in the first and last weeks were helpful locally but not sufficient. In the central counties and the section eastward, including nearly all of the bluegrass region, such showers as occurred were too light to mitigate the prevailing drought conditions, which grew worse as the month advanced. While corn and tobacco made fairly satisfactory growth in the southern and western counties, their progress in the dry central and eastern districts was arrested, with extensive firing and general deterioration on slopes and on soils not especially adapted to withstand dry weather. In the Burley tobacco area plants were badly dwarfed and had to be cut prematurely. Cutting had been completed on many farms by the end of the month. Weather conditions were exceptionally favorable for curing. Some fall plowing was accomplished in the southern and western counties, but the soil became too dry late in the month. Pastures were benefited temporarily where heavy rains occurred, but precipitation was not sufficient to revive them permanently except in a few extreme western localities. Water for stock and domestic purposes became short in the central dry area. Growth of forage crops ranged from poor in the central counties to good in some western districts. The hay was saved in excellent condition. Cotton in the southwestern counties made fairly good progress. Field tomatoes, gardens, and fall truck were cut short in most sections. The month closed with preparations for seeding mostly at a standstill and a general need for soaking rains.

TEMPERATURE.

The reports of 44 stations gave an average temperature for the State of 74.0°, which is 1.6° below the August normal. Rather lengthy periods of subnormal temperature occurred near the beginning, in the middle, and at the end of the month. Warm periods were brief, with high temperatures on only a few days. The highest for the State was 100° at Murray on the 3d, St. John on the 13th, and Bowling Green on the 23d; while the lowest was 37° at Farmers on the 18th.

PRECIPITATION.

Rainfall reports from 85 stations gave a state average of 2.06 inches, which is 1.67 inches less than normal. This is one of the four lightest precipitation averages of record for August. In the north-central counties and extending into the bluegrass region, where the drought reached its greatest intensity monthly amounts ranged from 0.3 to 1.0 inch. They increased in all directions from this dry area, reaching 4.0 to 5.0 inches in the Purchase and ranging from 2.0 to 3.0 inches in the southern and eastern mountain counties. The eastern and northern bluegrass region, which also suffered from drought, received from 2.0 to 2.5 inches, the amount increasing eastward and northward. Showers occurred in the western districts almost daily from the 1st to 12th, and again on the 14th and 24th. They were heavy in many localities. In the central and eastern

Averages, totals, and departures have been computed only for such stations as have ten or more years of record, but all available reports are published.

Dashes indicate that data are not available. Dates are given for the first day of the month on which occurred the highest temperature and the lowest, and the greatest daily range, the greatest precipitation in 24 hours, and the greatest number of days with precipitation of .01 inch or more; if these occurred on more than one day of the month, the number of such days is given, or the first two dates.

Precipitation includes rain, melted snow, sleet, and hail. Trace is entered for amounts too small to measure. Snowfall is recorded in inches and tenths, that occurring on the same day with rain being measured in the rain gage.

Dates of occurrence are given for the following extremes and numbers of days: Temperature: Highest, lowest, and greatest daily range. Precipitation: Greatest in 24 hours, total snowfall unmelted, and numbers of days with precipitation of .01 inch or more, clear, partly cloudy, and cloudy.

Prevailing direction of wind is that of the resultant movement, determined from the records of a 4-direction (n., e., s., w.) or 8-direction (n., ne., e., se., s., sw., w., nw.) wind vane.

Observers are those to whom the records are credited, but in many cases the data are taken from automatic records.

[a] Records for Louisville, Cherokee Park, and Anchorage are used for comparisons.

[b] Records for Hopkinsville, Owensboro, and Paducah are used for comparisons.

[c] Records for Greenville, Marion, and Murray are used for comparisons.

[k] Records for Bowling Green are used for comparisons.

[l] Records for Middlesboro are used for comparisons.

† Also on other dates.

Except as otherwise indicated observations are generally made at the afternoon hour of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount been previous 24 hours. * Precipitation included in the next following measurement.

Blank indicates data not received. T. Trace, or less than 0.005 inch.

Flood discharge area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak

to 14th, and also on the 18th, 22d, 23d, 24th, and 27th.

MISCELLANEOUS.

River. — Low stages prevailed in all streams of the State during the month.

Daily Temperatures for August, 1929.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. CRISWELL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., SEPTEMBER, 1929 No. 9

GENERAL SUMMARY.

Moderate to heavy rains at the end of the first week relieved the prevailing drought in the northern and eastern counties; but the south-central districts remained dry until about a week later, when heavy rains visited all parts of the State. Before the occurrence of these rains moisture in the southern and western counties had been sufficient to maintain growth. That section received the heaviest rains and suffered for a time from too much moisture, with resulting damage to field tomatoes and hay, and delay in farm operations. In the dry areas the rains came too late to be of much benefit to the principal crops; for most early tobacco had been cut and early corn had practically matured. Late corn had largely tasseled without shoots, and the tobacco was so badly dwarfed as to render unlikely its development and ripening before killing frost. The persistent dryness of the first half and the cold winds of the third week retarded the curing of tobacco. The low temperatures that followed the first rains and continued without a break into the last week adversely affected the late crops. Light frost was reported from the northeastern counties on the 19th. Fair weather that predominated after the 15th, and the few warm days near the close, were favorable features. Much late hay was made from alfalfa, soybeans and cowpeas during this period of good weather. Pastures revived, made fairly rapid growth, and were in excellent condition at the close of the month. Late potatoes which had withstood the dry weather grew out remarkably after the rains, reaching the blossoming stage in the last week. The first and last few days were favorable for cotton, otherwise the weather was too wet or too cool. Bolls opened more rapidly in the last week, and there was some picking. The rains restored the soil to good condition for fall plowing and seeding. Considerable early rye was up and some wheat had been sown in the northern counties by the close. The weather of the last half was favorable for corn cutting and silo filling. The latter activity absorbed much of the late and otherwise worthless corn.

TEMPERATURE.

Temperature reports from 42 stations gave an average for the state of 69.5°, which is 0.9° below the normal for this month. Short periods of relatively warm weather occurred near the beginning and end of the month, otherwise temperatures almost continuously below normal prevailed. The cool weather culminated in deficiencies 10° to 17° below normal in the period 15th-18th, with minima below 40° at many stations. Extremes for the State were 97° at Glower Dam on the 5th and 35° at numerous stations on the 20th.

PRECIPITATION.

As determined from reports of 82 stations, the average precipitation was 4.69 inches, which is 1.86 inches more than normal for September. The excess was greatest in the upper Cumberland and lower Ohio valleys, where 6.0 to 8.0 inches prevailed. A few stations in the lower Licking Valley also reported amounts of 8.0 or more. In the south-central part of the State and the eastern mountain counties, amounts ranged from 2.0 to 4.0 inches. In other districts from 4.0 to 6.0 inches occurred. Rains were general and usually quite heavy on the 5th and 6th, and frequent light to moderate showers occurred in the period 9th-18th. The [illegible] and the [illegible] observed in the period [illegible]

State average and range				69.5	− 0.9	97	5	35	20	48										

Averages of climatological data for the State as a whole are computed only for such stations as have ten or more years of record, but all complete reports are published from all stations. Departures from normal temperature and precipitation are computed only for such stations as have records for the same length of time as the normals. Dates in determining section or division means

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.

Additional dates. †Frequent dates to be included in means and summaries. ‡ Precipitation is less than 0.01 inch. Red House Ky. ? Scott, Independence, Ky.

¶ Post-office addresses.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House Ky. ? Scott, Independence, Ky.

MISCELLANEOUS.

Scattered damage from wind occurred in other northeastern counties as far east

Sept. 5. A woman who had taken refuge in a barn near Auburn was killed by Mason. A farmer was killed by lightning while in his barn near Mt. Sterling.

Sept. 7. In Montgomery County three barns were destroyed by wind. A barn was Scott, s. At least one Kentucky wife was killed when lightning struck the kitchen

which she was at work.

destroyed by lightning in Montgomery County. Other buildings

Sept. No important changes occurred in river stages during month.

Daily Precipitation for September, 1929.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION
JAMES L. CANDLER, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., OCTOBER, 1929 No. 10

GENERAL SUMMARY.

Dry weather during the first three weeks favored the completion of most fall work, and accelerated the maturity of late crops. Prevailing low temperature, however, had a retarding tendency on growth and ripening. Corn in shock dried out thoroughly, permitting gathering to begin by the middle of the month; but the prolonged rainy spells of the last decade delayed this work and prevented most other outdoor activities. Toward the end of the long dry period soil moisture became so depleted as to seriously interfere with plowing and seeding. During the first decade germination and growth were generally satisfactory, but grain sown later sprouted irregularly or lay in the ground until the rains of the 20th. These rains came in time to prevent much grain from perishing after sprouting and to bring up the later sowings early enough for deep rooting before winter. In the period following the rains winter grains made good progress, which was stimulated by temperatures above normal in the last week. Although somewhat undersized, wheat showed an excellent stand and was growing vigorously at the end of the month. There was no general killing frost. Temperatures fell to freezing or slightly lower at some northern stations in the period 24-26th, with killing frosts on lowlands; and heavy frosts in most of the northern half of the State. On uplands nearly everywhere growth continued throughout the month, retarded at times by spells of subnormal temperature. The extension of the growing season beyond the usual limits permitted late potatoes and much late corn to reach maturity. Gardens continued to produce some vegetables such as beans and tomatoes until the end of the month. Pastures had again become short and the growth of grass had practically ceased because of the long dry spell. They revived slowly, delayed at first by low temperature but benefited later by several warm days. They developed sufficiently to provide fairly good grazing and considerably reduce the feeding requirements.

TEMPERATURE.

Reports from 43 stations gave a temperature average for the State of 56.4°, which is 1.8° below the October normal. Abnormally cool weather prevailed in the 5-days period at the beginning of the month and of the third decade, otherwise temperatures were generally variable with no marked departures from the normal. At many stations in the central and western counties freezing temperature was not recorded during the month. The extremes for the State were 85° on several days at several western stations, and 25° at Farmers on the 18th.

PRECIPITATION.

The State average, based on reports from 84 stations, was 4.05 inches, which is 0.88 inch more than the October normal. It was light along the lower 38.5° and in some southeastern counties, where amounts ranged from 1.7 to 2.5 inches. A belt of heavier rainfall extended from north to south across the central counties, with monthly totals varying between 4.0 and 6.0 inches. Like amounts also occurred in the Big Sandy Valley and adjoining counties. Other districts received from 3.0 to 4.0 inches, and show a fairly good distribution of the month's rainfall. For the State precipitation ranged between 1.30 inches at Middlesboro and 7.23 inches at Jenkins. Only light and local showers occurred from the 1st to 19th. The heavy general rains of the 20th-23d included most of the month's precipitation. Light to heavy and somewhere local rains occurred in the period 28th-31st. Thunder storms were reported on the 20th and 21st, and snow flurries from some northern stations on the 24th.

PRECIPITATION AND WIND.

Average temperatures for the morning observations, the maximum temperature then read is charged to the preceding day, on which it almost always occurs.
Average temperatures for the month are for the entire month, missing items from record.
Western Division, Bowling Green.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXIV LOUISVILLE, KY., NOVEMBER, 1929 No. 11

GENERAL SUMMARY.

Moderate temperature until the middle of the month permitted slow growth of fall grains and half hardy vegetables. This period of favorable weather was quite important for undersized wheat, which gained much of the deep rooting necessary for resistance to winter. Pastures remained good, although at times too water soaked for grazing. Heavy rains kept the soil saturated most of the times, with delay to corn gathering and the digging of late potatoes. Feeding requirements continued light and milk production was well maintained. The first general killing frost occurred on the 5th, ending the growing season in the central, western and southern counties, with the longest frost-free period on record for many stations. This moderate weather in the first half of the month was in marked contrast to that which followed. At the beginning of the last decade temperatures fell far below normal, with hard freezes and the cessation of fall growth. This cold weather persisted, with only light interruptions, until the end of the month, culminating on the 30th with temperatures near zero in most districts and below zero at many northern stations. Light snow on the 28th in the central and eastern counties preceded the most severe weather and afforded some protection to grains. Because of the saturated condition of the soil and the sudden plunge from growing conditions into mid-winter severity, there was apprehension of injury to wheat. While there was some heaving effect, no evidence of serious injury appeared. The onset of the severe weather practically stopped all outdoor work except feeding and care of stock, leaving much corn in the field and some late potatoes in the ground. Heavy feeding of stock and complete winter protection became immediately necessary. The very dry atmosphere accompanying the cold weather made handling of tobacco difficult and considerably retarded stripping and marketing.

TEMPERATURE.

The records of 42 stations gave a temperature average of 44.6°, which is 1.8° below normal. Temperatures 5° to 15° above normal prevailed from the 1st to 3d and 10th to 14th, while daily deficiencies ranged from 4° to 20° in the period 19-26th and from 10° to 33° on the last three days. Minima on the 30th were zero to 9° below in the coldest district, which extended from Hardin to Rowan County. Extremes for the State were 82° at Harlan on the 1st and − 9° at Shelbyville on the 30th. Low temperature records for November were broken.

PRECIPITATION.

As determined from the reports of 83 stations, precipitation for the State averaged 4.03 inches, which is slightly above normal. It was fairly well distributed, but there was a moderate increase from 2.5 inches in the southwestern counties to about 5.0 inches in northeastern districts. In the southeastern mountain region it was much heavier, with amounts ranging between 4.5 and 8.0 inches. For the State the variation was between 2.13 inches at Owensboro and 7.82 inches at Middlesboro. Moderate to heavy rains occurred in the periods 1st-3d and 13-14th, and in the eastern counties on the 17-18th. Light precipitation was reported on most other days in the second decade, and also in the periods 22-25d and 26-29th. This was mostly snow on the 21st, 22d, 28th and 29th. The total snowfall ranged between 1.0 and 4.0 inches in most of the State. It was heaviest in the southeastern mountain region, where 6.0 to 8.0 inches occurred. Thunderstorms were reported on the 12th, 14th, and 16th.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. ‡‡ Received too late to be included in means and summaries ¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

§Lone Oak.

T Precipitation is less than 0.01 inch rain or melted snow

MISCELLANEOUS.

Nov. 27. Windstorms caused damage to buildings and wire systems estimated at $3,000 in Woodford, Fayette and Jefferson counties.

Floods.—A rise that started in the Ohio on the 14th and was augmented later by heavy rains in two upper basins caused fairly high crests by the 22d-25th, but did not reach flood stage. Moderate rises occurred in the Big Sandy, Green, and Cumberland on the 4th and 16th.

Errata for October, 1929.

State departure mean temperature from normal should be −1.8 instead of +1.8.

Williamsburg, departure of precipitation from normal should be −1.23.

Earlington, lowest temperature 35 on 25th.

St. John, monthly mean temperature 57.8; departure from normal +0.1.

Daily Precipitation for November, 1929.

Vol. XXXIV Louisville, Ky., December, 1929 No. 12

GENERAL SUMMARY.

The temperature was characterized by periods of marked severity and extreme mildness. The cold spell with which the preceding month ended continued through the first four days, causing minimum temperatures near the record for this month at some stations. A long period of mild weather followed, in which temperatures scarcely fell below freezing and hardy vegetation again began to grow. In the week of cold weather from the 18th to 25th minima near zero occurred at many stations, but the month closed with mild and spring-like conditions. Precipitation was frequent but not generally heavy. Fog and mist were unusually prevalent in the warm periods, interfering or rendering impossible aviation activities. The resulting high humidity, together with the high temperature, provided exceptionally favorable conditions for handling tobacco; but at times the weed became too damp for packing or handling in bulk. Either because of cold or muddy fields little progress could be made in gathering the corn that remained out. Corn in crib and shock was frozen with a large moisture content, and when thawed but could not dry out because of the saturated atmosphere. This condition resulted in considerable soured corn and apprehension as to probable serious injury to seed corn that had not been artificially dried. Moderate to heavy snow accompanied the temperature declines of the 2d and 22d, giving some protection to grain for three to four days of the worst weather in each case. Although the freezes were deep and more severe than usually experienced so early in the winter, grains did not suffer much injury from heaving. Apparently the upper layers of the soil had sufficient time at the onset of the cold waves to drain partly, so that ice columns did not form. Also the ground once frozen remained in that condition until completely thawed, without partial day thaws and night freezes. Due to the advent of the cold when growth was in progress, some discoloration and killing of tops resulted.

TEMPERATURE.

Reports from 43 stations gave a temperature average of 39.0°, which is 1.5° above normal. Daily deficiencies of 10° to 30° below normal occurred in the first four days and in the period 19-24th, while departures nearly as great in excess of normal were the rule on most days in the periods 6-17th and 26th-31st. Minima of zero to 15° below were registered at most stations on the 2d and 4th. Extremes for the State were 76° at Greenville on the 10th and −15° at Eubank on the 3d.

PRECIPITATION.

The State average, as determined from reports of 84 stations, was 2.72 inches, which is 1.31 inches less than normal for December. Distribution was quite irregular for a winter month. In the western counties and a limited area in the northeastern part of the State, from 3.0 to 4.0 inches occurred; while a broad belt extending from the Ohio River across the bluegrass region to the Tennessee and Virginia borders received 1.5 to 2.0 inches. For the State as a whole rainfall between 1.38 inches at Pikeville and 4.56 inches at Grayson, Carter County. Snowfall was generally heavy, about 7.0 to 8.0 inches occurring in the northern and western counties and 10 to 13 inches in the basin of the upper Green and upper Cumberland, and in the southeastern mountains. During the extended periods of warm weather, the snow over aviation fields gradually without ...

ing flood conditions. Light [illegible] rate runs occurred in the periods [illegible] and 25th to 27th and snow on the 2d and 22d. [illegible] a few sailings on the Ohio and [illegible].

[illegible] precipitation data are taken from self-recording instruments.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. Brewersville and Woodbury are Lockson the Green River; other Locks are on the Kentucky River [illegible] by determining weekly or by other means. †Many. [illegible] Brewersville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River [illegible] by determining weekly or by other means. †Many. [illegible] for example, † represents two days, etc.

Reference letters, a, b, c, appearing in the table indicate number of days missing for example, a represents two days, etc. † Precipitation is less than 0.01 inch rain or melted snow. ‡Long Oak.

Also [illegible] other letters. eReported too late to be included in means and summaries. †Precipitation is less than 0.01 inch rain or melted snow. ‡Long Oak.

Also [illegible] other letters. eReported too late to be included in means and summaries. †Lock 10, Red Houses, Ky.; Lock 11, Nicholasville Ky.; Lock 12, Versailles, Ky.; Lock 13, Wilmore, Ky.; Lock 14, Nicholasville Ky.

[illegible] addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 4 Nicholasville Ky.

MISCELLANEOUS.

[illegible] A [illegible] rate was observed in the Ohio from the 15th to the 21st, with stages [illegible] ice was found in the Evansville district. Tree [illegible] was frozen at Lakin on the 24 and [illegible] from the 1st to the 3rd, and [illegible] things from the 24th to 27th. Moderate [illegible] occurred on the [illegible] of the 19th and 31st.

Errata for November, 1929.

Beaverdam, clear days 7; partly cloudy 6.

Hopkinsville, mean temperature 44.8; departure 3.7

Daily Precipitation for December, 1929.

VOL. XXXIV LOUISVILLE, KY., ANNUAL, 1929 No. 13

GENERAL SUMMARY.

The temperature for the year averaged near normal, but in several months it departed widely from seasonal conditions. February was decidedly cold, but because the low temperature was practically continuous no damage of consequence resulted to winter grains. In marked contrast the temperature excess of March was greater than the temperature deficiency of February. With April also much warmer than normal, spring arrived exceptionally early and vegetation developed so rapidly as to endanger it from late frosts. Although the usual April frosts were not severe, they caused considerable damage to fruit because of its unseasonal advancement. On account of the character of the winter, with its long cold periods and relatively few thaws, wheat suffered little and emerged in vigorous condition. Its rapid growth and early jointing caused some anxiety, but the comparative mildness of the April cool spell enabled it to escape without injury. With the precipitation of March and April not far from normal in the agricultural regions, conditions favored rapid progress in soil preparation, early seeding, and satisfactory germination. An excess of rain in May adversely affected these activities, with delay to corn planting. This wet period favored tobacco transplanting, which was finished rather early with excellent stands. The summer and fall months were relatively cool. Except for two weeks of cool weather, June was a favorable month, with well distributed rainfall. In the other two summer months precipitation varied greatly as to amount and distribution. In July drought conditions appeared in the west-central districts. During August, which was the driest month, the drought became much worse and extended eastward over most of the bluegrass section. The growth of tobacco and corn was arrested at the critical period, with the dwarfing of the one and the failure of the other to make ears. In this central area, these crops suffered extensive damage. Drought conditions were modified by increased rainfall toward the borders of the State. Rains early in September revived pastures, late gardens, and late forage crops, and moistened the soil for plowing and seeding. October was cool and generally too dry, but moisture was sufficient to sprout fall gardens and keep them growing. General killing frost was delayed until early in November, which permitted slow but steady growth of grasses and grains to continue until they were in vigorous condition to enter the winter. Severe winter weather late in November and periodically in December interfered with corn gathering but the warm moist spells in December were favorable for handling tobacco.

The Weather By Months

JANUARY.---Variable temperature, with resulting freezes and thaws, was unfavorable for winter grains. Unseasonably high temperature and severe windstorms occurred in the third week.

FEBRUARY.---The month was abnormally cold, with few complete thaws, hence grains suffered little. Heavy rains and melting snow near the end caused floods in most streams. Roads were damaged by the deep freezes.

MARCH.---High temperature, with conditions favorable for outdoor activities, predominated. Vegetation and agricultural preparation made exceptional progress. Excessive rains in the mountain counties caused disastrous floods.

APRIL.---Although the temperature averaged above normal, relatively cool weather during much of the month checked the premature development of crops and caused delay in corn and cotton planting. Spring preparations reached an advanced stage early in the month. Remarkably heavy hail was reported from many localities on the 21st.

MAY.---Low temperature and heavy rains rendered the month unfavorable. Weather conditions changed for the better with the rise in temperature of the last week. Local storms were frequent and damaging.

JUNE.---Weather unfit for hay harvest continued through the first half, but conditions were more favorable later on. Even in this period, however, there was sufficient dry weather to permitof crop cultivation.

JULY.---Temperatures were mostly moderate and favorable. Rains were fairly heavy and generally sufficient in the eastern counties, but dry weather began to affect crops in central and western districts.

AUGUST.---Low temperature offset to some extent the effect of the drought. Rains in the western counties early in the month relieved conditions. The dry weather caused much premature and unusually early tobacco cutting.

SEPTEMBER ---The rains came too late for most late crops; also the temperature was low and unfavorable for growth during a large part of the month. Much late corn was worthless except for the silo.

OCTOBER.---Although rather cool the month was generally favorable for growth. Temperature above normal in the first week gave fall grains a good start.

All temperature data are taken from self-registering thermometers. †Also on other dates.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

NOVEMBER.—The first general killing frost occurred on the 5th. The month ended with very cold weather and record low temperature.

DECEMBER.—Periods of marked severity and extreme mildness alternated. Corn | froze in damp condition and the mild weather that followed was unfavorable for drying. Outdoor work was difficult, but much weather favorable for tobacco handling prevailed.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

T. Precipitation is less than .01 inch rain or melted snow.

†Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Monthly and Annual Mean Temperatures for the Year 1929, with Departures from the Normal.

All temperature data are taken from self registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or divis on means.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or divis on means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

NOTE.—Tables and charts giving climatic data for Kentucky in detail during 1929 have been published for each month at the Kentucky section center. Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in charge at that office. In lexes to special articles published during past yea s in Kentucky climatological reports may be found in the Monthly Report for June, 1909.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION
JAMES L. KENDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., JANUARY, 1930 No. 1

GENERAL SUMMARY.

Mild temperature predominated during the first two weeks and decidedly cold weather thereafter. In the warm period temperature fell but little below freezing on the coldest nights and springlike conditions prevailed. Grains and grass made some growth, while early shrubs and bulbous plants showed signs of budding. Peach buds gave evidence of expansion, which contributed to their injury in the weather that followed. A sharp change to colder on the 15th was followed by almost continuous subnormal temperature until the end of the month. By the morning of the 18th temperatures had fallen below zero and ranged from 5° to 20° over the State. It is believed that these severe temperatures largely killed peaches. Another spell of subzero temperatures occurred about the 23d. Snow accompanied the first cold wave, and occurred at intervals until the close of the month. A moderate amount remained on the ground through the severest weather, affording considerable protection to grains. Nearly all of the precipitation in the last half occurred in the form of snow. After freezing deeply near the middle of the month the soil remained in that condition, hence winter grains were but little affected by heaving. In the first two weeks frequent and often heavy rains caused flooding of lowlands in the western counties, with damage to grains from standing water. Supersaturation of flat land also caused considerable injury. Dirt and macadam roads deteriorated rapidly, retarding the movement of tobacco. Late in the month icy roads interfered with traffic. Despite the condition of the roads the movement of tobacco was large, because the long period of mild weather in the first half had been continuously favorable for handling the weed and had resulted in extensive preparation of the crop for market. The rather sudden onset of the cold weather and its persistence for such an extended period caused much suffering and privation.

TEMPERATURE.

Departures of 10° to 25° in excess of normal occurred on most days during the first two weeks. These were offset by frequent daily deficiencies of 10° to 24° in the latter half. As a result the State average of 34.6° for the 44 reporting stations was but little below normal. The 18th was the coldest day experienced in the State since January, 1918. The extremes were 75° at Williamsburg on the 9th and −20° at Murray on the 18th, which gives the extraordinary range of 95° for the month.

PRECIPITATION.

The average for the State, based on reports from 85 stations, was 4.85 inches, which is 0.50 inch greater than normal. There was a fairly regular decrease eastward from an excessively wet district in the extreme western counties, which received 11.00 inches, to a relatively dry area in the eastern mountain section, where only 1.5 to 2.0 inches occurred. Monthly amounts ranged between 0.48 inch at Pikeville and 11.10 inches at Mayfield. Rains were moderate in the periods 1st-3d and 27-28th, and moderate to excessive in the second week. The heaviest rains occurred in the western counties from the 7th to 9th. The snowfall reported from 75 stations averaged 3.8 inches. In the counties along the Ohio from the Tennessee to the Kentucky it ranged between 5.0 and 9.0 inches. A few southeastern counties received 6.0 inches or more. From 2.0 to 4.0 inches occurred in other parts of the State. Except to a limited extent on the Green, the heavy rainfall did not affect the upper basins of the rivers. Thunderstorms were reported from a few stations on the 13th and 14th.
